Mitigation Measures xiii
Summary of Findings xvii

1 Introduction and Project Description 1
1.1 Report Purpose and Scope 1
1.2 Project Location 1
1.3 Existing Site Conditions 1
1.4 Project Description 2
1.5 Lithium Valley Specific Plan Measures 2

2 Air Quality 9
2.1 Environmental Setting 9
2.1.1 Climate and Meteorology 9
2.1.2 Pollutants and Effects 10
2.1.3 Sensitive Receptors 16
2.1.4 Background Conditions 17
2.2 Regulatory Setting 21
2.2.1 Federal Regulations 21
2.2.2 State Regulations 21
2.2.3 Local Regulations 28
2.3 Significance Criteria and Methodology 34
2.3.1 Thresholds of Significance 34
2.3.2 Approach and Methodology 35
2.4 Impact Analysis 75
2.4.1 Would the project conflict with or obstruct implementation of the applicable air quality plan? 75
2.4.2 Would the project result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard? 79

2.4.3 Would the project expose sensitive receptors to substantial pollutant concentrations? 116
2.4.4 Would the project result in other emissions (such as those leading to odors) adversely affecting a substantial number of people? 121

3 Greenhouse Gas Emissions 123
3.1 Environmental Setting 123
3.1.1 Climate Change Overview 123
3.1.2 Greenhouse Gases 123
3.1.3 Global Warming Potential 125
3.2 Greenhouse Gas Inventories and Climate Change Conditions 126
3.2.1 Global Inventory 126
3.2.2 National Inventory 126
3.2.3 State Inventory 127
3.2.4 Local Inventory 127
3.2.5 Potential Effects of Climate Change 128
3.3 Regulatory Setting 131
3.3.1 Federal Regulations 131
3.3.2 State Regulations 133
3.3.3 Local Regulations 146
3.4 Significance Criteria and Methodology 149
3.4.1 Thresholds of Significance 149
3.4.2 Approach and Methodology 151
3.5 Impact Analysis 154
3.5.1 Would the project generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment? 154
3.5.2 Would the project conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of greenhouse gases? 166

4 Energy 177
4.1 Environmental Setting 177
4.1.1 Electricity 177
4.1.2 Natural Gas 177
4.1.3 Petroleum 178
4.2 Regulatory Setting 178
4.2.1 Federal Regulations 178
4.2.2 State Regulations 180
4.2.3 Local Regulations 182
4.3 Significance Criteria and Methodology 184
4.3.1 Thresholds of Significance 184
4.3.2 Approach and Methodology 184

4.4 Impacts Analysis 187
4.4.1 Would the project result in potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy resources, during Project construction or operation? 187

INTENTIONALLY LEFT BLANK

Executive Summary

The purpose of this technical report is to assess the potential air quality, greenhouse gas (GHG) emissions, and energy impacts associated with implementation of the proposed Lithium Valley Specific Plan Project (LVSP/proposed project/project) in the County of Imperial (County), California. This assessment utilizes the significance thresholds in Appendix G of the California Environmental Quality Act (CEQA) Guidelines (14 CCR 15000 et seq.) and is based on the emissions-based significance thresholds recommended by the Imperial County Air Pollution Control District (ICAPCD) for air quality and other applicable thresholds of significance. This report is intended to support the Program Environmental Impact Report prepared for the LVSP.

Project Overview

The LVSP aims to develop a Specific Plan in the northern portion of the Imperial Valley, specifically along the southeastern part of the Salton Sea, that plans for the continued development of renewable energy and related industries including the extraction, refinement, and manufacturing use of lithium. The Specific Plan Area (Plan Area) covers approximately 51,622 acres and consists primarily of existing agricultural properties, wetlands, wildlife areas, open spaces, and energy facilities. A first phase or focus area of approximately 10,000 acres has been identified and is intended to include the most near-term development and uses. The goal of the project is to frame and guide the development of renewable energy sources, such as geothermal and solar energy, as well as lithium extraction and associated industrial uses and infrastructure improvements. The development is driven by federal and state renewable energy and GHG reduction goals, with a focus of providing resources for battery-powered vehicles. The project would require the construction of facilities and infrastructure to support these developments. The project site is located within the Salton Sea Air Basin and is under the jurisdiction of ICAPCD.

Air Quality

The air quality impact analysis evaluates the potential for adverse impacts to air quality due to construction and operational emissions resulting from the project. Impacts were evaluated for their significance based on the ICAPCD mass daily criteria air pollutant thresholds of significance. Criteria air pollutants are defined as pollutants for which the federal and state governments have established ambient air quality standards, or criteria, for outdoor concentrations to protect public health. Criteria air pollutants include ozone, nitrogen dioxide, carbon monoxide (CO), sulfur dioxide, particulate matter (PM) with an aerodynamic diameter less than or equal to 10 microns (PM_{10}, also known as coarse PM), PM with an aerodynamic diameter less than or equal to 2.5 microns ($PM_{2.5}$, also known as fine PM), and lead. Pollutants that are evaluated include volatile organic compounds (VOCs) (also referred to as reactive organic gases (ROGs)), oxides of nitrogen (NO_x), CO, sulfur oxides (SO_x), PM_{10}, and $PM_{2.5}$. VOCs, and NO_x are important because they are precursors to ozone.

Air Quality Plan Consistency

The Plan Area falls under the jurisdiction of ICAPCD, which oversees air quality compliance through plans like the 2018 Redesignation Request and Maintenance Plan for Particulate Matter less than 10 Microns in Diameter and the 2017 State Implementation Plan for the 2008 8-Hour Ozone Standard. The proposed project aligns with local land use designations, including allowances for geothermal development, and supports the Southern California Association of Governments' regional goals for sustainable growth. However, the project's scale, particularly the

creation of approximately 40,000 jobs and increased development density, exceeds regional growth projections used in air quality planning.

The project would exceed the growth forecasts used to develop ICACPD's attainment plans. Thus, the project would potentially conflict with or obstruct the applicable air quality plan prior to mitigation. Implementation of Mitigation Measure (MM)-POP-1 would ensure that the appropriate residential and employment growth projections of the Plan Area would be incorporated into the next Southern California Association of Governments Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS) (anticipated to be the 2028 RTP/SCS). Nonetheless, the LVSP would still conflict with the regional growth projections used to prepare the air quality management plans (AQMPs) for the Salton Sea Air Basin.

The project would not conflict with the applicable portions of the County North End Phase 1 Community Emissions Reduction Program.

Therefore, the project's potential to conflict with or obstruct implementation of the applicable air quality plan would be **significant and unavoidable.**

Potential to Result in a Cumulatively Considerable Net Increase of Any Nonattainment Criteria Pollutant

Construction Criteria Air Pollutant Emissions

Construction of the LVSP would result in the temporary addition of pollutants to the local airshed caused by on-site sources (i.e., off-road construction equipment, soil disturbance, and VOC off-gassing) and off-site sources (i.e., on-road haul trucks, vendor trucks, and worker vehicle trips). Construction of Phase 1, Phase 2, and Phase 3 of the project would exceed the criteria pollutant thresholds for VOCs, NO_x, CO, PM_{10}, and $PM_{2.5}$ established by ICAPCD with implementation of LVSP measures and regulations, resulting in a **significant** impact prior to mitigation. MM-AQ-1 through MM-AQ-5 would be implemented to reduce the project's criteria air pollutant emissions during construction but were not quantified. Therefore, construction-related impacts associated with a cumulatively considerable net increase of any criteria pollutant for which the project region is nonattainment would be **significant and unavoidable**.

Operational Criteria Air Pollutant Emissions

Operation of the LVSP would generate criteria air pollutant emissions from mobile sources (vehicular traffic), area sources (hearths, consumer products, architectural coatings, and landscaping equipment), energy sources (natural gas consumption), off-road equipment, and stationary sources. During operation of two interim phases and buildout, the project would exceed the numerical thresholds of significance established by ICAPCD for emissions of VOCs, NO_x, CO, PM_{10}, and $PM_{2.5}$ with implementation of LVSP measures and regulations, resulting in a **significant** impact prior to mitigation. MM-AQ-5 through MM-AQ-10 and MM-TRA-1 through MM-TRA-4 would be implemented to reduce the project's criteria air pollutant emissions during operation but were not quantified. Therefore, the project would result in a cumulatively considerable increase in emissions of nonattainment pollutants, and the impact would be **significant and unavoidable**. Concurrent construction and operational activities would also exceed the numerical thresholds of significance recommended by ICAPCD for operational emissions of VOCs, NO_x, CO, PM_{10}, and $PM_{2.5}$.

Exposure of Sensitive Receptors

Carbon Monoxide Hotspots

The project would not expose sensitive receptors to localized high concentrations of CO or contribute to traffic volumes at intersections that would cause a CO hotspot during construction or operation. As such, potential construction or operational CO hotspot impacts would be **less than significant** without mitigation.

Health Risk

An health risk assessment was performed to estimate the Maximum Individual Cancer Risk and the chronic hazard index for proximate residential receptors because of project construction and operation. The project's toxic air contaminant (TAC) health risk impacts would be **significant** prior to mitigation.

MM-AQ-1 through MM-AQ-9 would be implemented to reduce the project's TAC emissions during construction and operation but were not able to be quantified. Therefore, impacts associated with exposing sensitive receptors to substantial TAC concentrations would be **significant and unavoidable**.

Valley Fever

Valley fever is not highly endemic to Imperial County. Nonetheless, in order to reduce fugitive dust from the project and minimize adverse air quality impacts, the LVSP would employ dust control measures in accordance with the rules under ICAPCD Regulation VIII, Fugitive Dust Control Measures, which limit the amount of fugitive dust generated during construction. Furthermore, the implementation of Policy Health and Prosperity (HP)-18 would go beyond the requirements of ICAPCD Regulation VIII and would be implemented to further reduce fugitive dust generated by the LVSP during construction. However, the magnitude of fugitive dust emissions (PM_{10}) during construction is substantial and significant, and impacts associated with valley fever exposure for sensitive receptors during construction would be **significant**. The project would implement MM-AQ-10, Valley Fever Exposure Minimization, which would reduce the impact of valley fever exposure for sensitive receptors during construction to **less than significant with mitigation.**

During operation, the LVSP would require that all roads used by future developments projects within the Plan Area would need to be paved, per Policy HP-19, Paved Roads, which would limit the amount of fugitive dust generated from vehicle travel. Operational activities would not involve substantial earth-moving activities, and valley fever spores would therefore have little potential to be released. As such, impacts associated with valley fever exposure for sensitive receptors during operation would be **less than significant**.

Other Emissions (Odors)

The analysis of other emissions (such as those leading to odors) is focused on the potential for an odor impact to occur. Potential odors produced during project construction would be attributable to architectural coatings, asphalt pavement application, and concentrations of unburned hydrocarbons from tailpipes of construction equipment, all of which would disperse rapidly from the project site and generally occur at magnitudes that would not affect substantial numbers of people. Impacts associated with odors during construction would be **less than significant**.

Land uses and industrial operations associated with odor complaints include agricultural uses, wastewater treatment plants, food processing plants, chemical plants, composting, refineries, landfills, dairies, and fiberglass

molding. Wastewater treatment plant and anaerobic digester facilities are proposed as land uses to be developed under the LVSP. Although these facilities are required to have advanced odor management systems (e.g., biofilters or carbon scrubbers) to control and minimize off-site odor impacts, they still have the potential to create new sources of odors during operation and would result in an odor impact that is **significant.** The project would implement MM-AQ-11, Odor Control and Abatement Program – Anaerobic Digester Facilities and Wastewater Treatment Plants, which would reduce the impact of odors during operation to **less than significant with mitigation.**

Greenhouse Gas Emissions

GHGs are gases that absorb infrared radiation in the atmosphere. Principal GHGs regulated under state and federal law and regulations and that are evaluated herein include carbon dioxide (CO_2), methane (CH_4), and nitrous oxide (N_2O). GHG emissions are measured in metric tons (MT) of CO_2 equivalent (CO_2e), which account for weighted global warming potential (GWP) factors for CH_4 and N_2O.

Construction and Operational Greenhouse Gas Emissions

For operations, because the LVSP is a Specific Plan project that allows for the development of multiple land uses across different sectors, the LVSP's operational GHG emissions are compared to the quantitative threshold of 3,000 MT CO_2e per year. In summary, operation of the LVSP plus amortized construction GHG emissions would exceed the 3,000 MT CO_2e per year threshold in Phase 1 (2035), Phase 2 (2045), and Phase 3 (2055). As such, the project would result in a **significant** impact. MM-GHG-1 through MM-GHG-4 would reduce GHG emissions associated with implementation of the LVSP. However, the effectiveness of all mitigation is not quantifiable, and the LVSP would still exceed the 3,000 MT CO_2e per year threshold in Phase 1 (2035), Phase 2 (2045), and Phase 3 (2055), resulting in a **significant and unavoidable impact**.

Potential to Conflict with Plans

The potential for the project to conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of GHGs is qualitatively evaluated through analyses of the LVSP's potential to conflict with state GHG reduction targets contained in the CARB 2022 Scoping Plan for Achieving Carbon Neutrality (2022 Scoping Plan) and relevant measures within the County Regional Climate Action Plan.

The project would not conflict with the overall goals of the 2022 Scoping Plan. The impact would be **less than significant.**

Overall, the LVSP would not conflict with the County Regional Climate Action Plan. The LVSP would support, as feasible, the measures and overarching goals therein to address the impacts of climate change and reduce GHG emissions in the region. Therefore, the impact would be **less than significant**.

Energy

Wasteful, Inefficient, or Unnecessary Energy Resource Consumption

During construction and operation, the project would consume energy, including electricity, natural gas, and petroleum. Renewable energy sources to be developed as part of the LVSP include geothermal facilities, commercial-scale photovoltaic fields, agrivoltaic solar fields, and floatovoltaic solar fields. The project would not

result in wasteful, inefficient, or unnecessary consumption of energy resources, including electricity, natural gas, or petroleum, during project construction or operation. Impacts would be **less than significant**.

Mitigation Measures

MM-AQ-1 Additional Construction Equipment Emission Reductions. Prior to the issuance of grading permits, an individual project applicant or its designee shall provide evidence to the County of Imperial (County) that the following strategies shall be implemented during the project's construction phase:

A. Use electric- or hybrid-powered equipment for generators and other small pieces of equipment over 25 horsepower (e.g., forklifts), as commercially available.

B. Use cleaner fuel equipment, such as replacing diesel fuel with compressed natural gas or renewable diesel, as commercially available.

Commercially available equipment is herein defined as equipment sourced within 50 vehicle miles of the project site and within 10% of the cost of the diesel-fueled-equivalent equipment. The individual project applicant must contact at least three contractors or vendors within the County and submit to the County justification if the specified equipment is not commercially available.

MM-AQ-2 Notification of Construction Activities. Prior to the commencement of any construction activities, the applicant or its designee shall provide evidence to the County of Imperial that the applicant has employed a construction relations officer who will address community concerns regarding on-site construction activity. The applicant shall provide public notification in the form of a visible sign containing the contact information of the construction relations officer, who shall document complaints and concerns regarding on-site construction activity. The sign shall be placed in easily accessible locations and noted on grading and improvement plans.

MM-AQ-3 Limit Truck and Equipment Idling During Construction. The project applicant shall reduce idling time of heavy-duty trucks, either by requiring them to be shut off when not in use or limiting the time of idling to no more than 3 minutes (thereby improving upon the 5-minute idling limit required by the State Airborne Toxics Control Measure to Limit Diesel-Fueled commercial Motor Vehicle Idling, 13 CCR 2485). The project applicant shall post clear signage reminding construction workers to limit idling of construction equipment.

MM-AQ-4 Use of Super-Compliant Low-VOC Paint During Construction. During construction, the project shall use super-compliant low-VOC (volatile organic compound) paint (less than 10 grams per liter VOC) for all interior and exterior paint applications for residential and nonresidential land uses.

MM-AQ-5 Low-VOC Cleaning Supplies and Paint Educational Program. Prior to the occupancy of any on-site development, the applicant or its designee shall provide evidence to the County of Imperial that the applicant/phase developer has developed a green cleaning product and paint education program, to be made available at rental and purchasing offices and/or on websites. The educational program shall include a flyer (hardcopy and/or digital) that includes, at a minimum, an

explanation of what volatile organic compounds (VOCs) are, how VOCs affect us, where to find low-VOC alternatives for cleaning supplies and paint, and additional resources for learning more.

MM-AQ-6 Landscape Maintenance Equipment Emission Reduction. The project applicant shall implement the following landscape maintenance equipment emission reduction measures:

a. **Include Outdoor Electrical Outlets.** Prior to the issuance of building permits, the project applicant or its designee shall provide evidence to the County of Imperial that the design plans include electrical outlets on structure exteriors to facilitate the use of electrical lawn and garden equipment.
b. **Encourage Use of Existing Yard Equipment Exchange and Rebate Programs.** Educational materials shall be provided to future residents about the Imperial County Air Pollution Control District Electric Lawn Mower Rebate Program and the Commercial Lawn Equipment Exchange Program. When conventional gasoline-powered yard equipment (e.g., lawn mowers, leaf blowers and vacuums, shredders, trimmers, and chainsaws) is exchanged for electric and rechargeable battery-powered yard equipment, direct greenhouse gas (GHG) emissions from fossil fuel combustion are displaced by indirect GHG emissions associated with the generation of electricity used to power the equipment.

MM-AQ-7 Idling Time Restriction. The following measure shall be implemented during all ongoing business operations and shall be included as part of contractual lease agreement language to ensure that tenants and operators of future development projects are informed of the following operational responsibility: Upon commencement of operations, the tenant/operator of future development projects shall be required to restrict truck idling on site to a maximum of 3 minutes, subject to exceptions defined by the California Air Resources Board's commercial vehicle idling requirements. The building manager or their designee shall be responsible for enforcing this requirement.

MM-AQ-8 Anti-Idling Implementation Measures. The following measures shall be implemented to reduce air pollutant emissions from idling during operations:

A. **Signage.** Legible, durable, weatherproof signs that identify the project's 3-minute idling restriction shall be placed at truck access gates, loading docks, and truck parking areas. At a minimum, each sign shall include: (1) instructions for truck drivers to shut off engines when not in use; (2) instructions for drivers of diesel trucks to restrict idling to no more than 3 minutes once the vehicle is stopped, the transmission is set to "neutral" or "park," and the parking brake is engaged; (3) telephone numbers of the building facilities manager and California Air Resources Board (CARB) to report violations; and (4) that penalties apply for violations. Prior to the issuance of an occupancy permit, the County of Imperial shall conduct a site inspection to ensure that the signs are in place.
B. **Efficient Load Management.** The facility operator(s) shall be required to train managers and employees on efficient scheduling and load management to eliminate unnecessary queuing and idling of trucks.
C. **Anti-Idling Training.** Tenants and operators at each project site shall ensure that site enforcement staff in charge of keeping the daily log and monitoring for excess idling will be trained/certified in diesel health effects and technologies, for example, by requiring attendance at CARB-approved courses (such as the free 1-day Course No. 512).

D. **Design of Ingress/Egress Points.** This mitigation applies to industrial land uses only. Entry gates into the loading dock/truck court areas shall be sufficiently positioned to ensure that all truck and other vehicles are contained on site and inside the property line. Queuing, or circling of vehicles, on public streets immediately pre- or post-entry to the project shall be strictly prohibited unless queuing occurs in a deceleration lane or right turn lane exclusively serving the Plan Area.

MM-AQ-9 Operational Backup Generator Emission Reductions. Prior to the issuance of building permits, an individual project applicant or its designee shall provide evidence to the County of Imperial (County) that any backup generators greater than 500 horsepower shall meet the U.S. Environmental Protection Agency's Tier 4 Final emission standards, to the extent feasible. If Tier 4 Final equipment is not available for a specific application, the project applicant shall provide documentation to the County demonstrating the unavailability and shall use the next-cleanest available technology, such as Tier 4 Interim or Tier 3 engines equipped with verified diesel emission control strategies, such as diesel particulate filters.

MM-AQ-10 Valley Fever Exposure Minimization. Prior to any ground-disturbing activities within Imperial County, the County of Imperial (County) or its designees shall implement the following valley fever provisions:

A. Between June 1 and November 30, when valley fever rates of infection are the highest, if wind speeds exceed 15 mph or temperatures exceed 95°F for 3 consecutive days, additional dust suppression measures (such as additional water or the application of additional soil stabilizer) shall be implemented prior to and immediately following ground-disturbing activities. The additional dust suppression shall continue until winds are 10 mph or lower and outdoor air temperatures are below 90°F for at least 2 consecutive days. The additional dust suppression measures shall be incorporated into the dust control plan.

B. Prior to any project forest treatment activity, the County shall prepare and implement a worker training program that describes potential health hazards associated with valley fever, common symptoms, proper safety procedures to minimize health hazards, and notification procedures if suspected work-related symptoms are identified during operation. The worker training program shall identify safety measures to be implemented by the County or its contractor during operation. Safety measures shall include the following:

- Provide HEPA-filtered air-conditioned enclosed cabs on heavy equipment. Train workers on the proper use of cabs, such as turning on air conditioning prior to using the equipment.
- Provide communication methods, such as two-way radios, for use by workers in enclosed cabs.
- Provide personal protective equipment, such as half-mask and/or full-mask respirators equipped with particulate filtration, to workers active in dusty work areas.
- Provide separate, clean eating areas with handwashing facilities for workers.
- Clean equipment, vehicles, and other items before they are moved off site to other work locations.

- Provide training for workers so they can recognize the symptoms of valley fever and promptly report suspected symptoms of work-related valley fever to a supervisor.
- Direct workers that exhibit valley fever symptoms to immediately seek a medical evaluation.

MM-AQ-11 Odor Control and Abatement Program – Anaerobic Digester Facilities and Wastewater Treatment Plants. Prior to issuing any building permits for odor-emitting facilities, the County of Imperial (County) or its designees shall implement the following odor control measures:

A. Odor Treatment Systems:
   - The County shall require the facility to install and maintain effective odor control technologies, such as biofilters, activated carbon filters, or scrubber systems, to capture and neutralize odorous gases at their source.
   - The County shall ensure that the facility conducts regular monitoring and maintenance to verify the performance of these odor control systems.

B. Regular Monitoring and Reporting:
   - The County shall mandate that the facility conduct regular odor monitoring at key locations around the site and at sensitive-receptor points (e.g., residential areas).
   - The County shall require the facility to submit periodic reports to ensure compliance with odor control standards and to evaluate the effectiveness of implemented measures.

C. Buffer Zones and Site Design:
   - The County shall ensure that an adequate buffer zone is maintained around odor-emitting facilities, including anaerobic digesters and wastewater treatment areas, to minimize exposure to sensitive receptors.
   - The County shall review and approve the facility's site design, ensuring that prevailing wind patterns and the distance to sensitive areas are considered, in order to reduce odor impacts.

MM-GHG-1 Energy Conservation – Prior to the issuance of building permits, the project applicant or its designee shall provide evidence to the County of Imperial that the building design plans include the following energy conservation measures:

- Install Energy Star–rated heating, cooling, lighting, and appliances.
- Outdoor lighting shall be light emitting diode (LED) or other high-efficiency lightbulbs.
- Install double-pane windows where possible.
- Prior to the issuance of building permits, the project applicant or its designee shall submit building plans illustrating installation of cool pavements in place of dark pavements. Outdoor pavements, such as walkways and patios, shall use paving materials with a 3-year solar reflectance index (SRI) of 0.28 or an initial SRI of 0.33.
- Provide information on energy efficiency, energy-efficient lighting and lighting control systems, energy management, and existing energy incentive programs to future residents of the project.

MM-GHG-2 Use Alternative Refrigerants Instead of High-GWP Refrigerants – Refrigerants with high global warming potential (GWP) shall be replaced with lower-GWP refrigerants (e.g., natural refrigerants such as carbon dioxide, ammonia, and hydrocarbons, or next-generation low-GWP synthetic refrigerants like hydrofluoroolefin-1234yf) in refrigeration and air conditioning equipment.

MM-GHG-3 Electric Vehicle Charging Infrastructure – Prior to the issuance of building permits, the project applicant or its designee shall provide evidence to the County of Imperial that the building design plans meet or exceed California Green Building Standards Code Tier 2 standards to encourage the use of electric vehicles.

MM-GHG-4 Sustainable Concrete Building Materials – Industrial Land Uses. The project shall be designed with sustainable materials that will reduce 35% of the overall carbon footprint compared to traditionally designed concrete tilt-up buildings. The following measures shall be implemented:

- The future developments shall reduce overall concrete in the slab by 10% through the use of a steel fiber mix to increase the overall strength of the concrete to reduce concrete thickness.
- The future developments shall reduce overall concrete in the tilt walls by 30% by providing 4-inch foam insultation in the middle of the concrete panel (also known as composite panels). Whereas traditional concrete tilt walls have no R-value, the foam insulation will result in an R-value of R-19, thereby reducing overall energy consumption and increasing occupant comfort.
- The roof shall have a 10% reduction in steel because of the lighter concrete tilt walls due to the foam insulation.
- The future developments' specifications shall require the use of sustainable concrete to reduce the project's overall carbon footprint by 35%.

MM-POP-1 SCAG Coordination and Inclusion in Regional Planning. Prior to recordation of the first final map or issuance of the first development permit (whichever occurs first), the County of Imperial shall submit the final adopted Lithium Valley Specific Plan to the Southern California Association of Governments for inclusion in regional planning documents, including the Regional Transportation Plan/Sustainable Communities Strategy and the Regional Housing Needs Assessment, as applicable. This action shall ensure that the employment and associated population growth facilitated by the Lithium Valley Specific Plan is recognized and incorporated into regional forecasts.

Summary of Findings

The results of this report are summarized in Table ES-1, below, based on the significance criteria in the impact analyses in Sections 2.4 (Air Quality), 3.4 (Greenhouse Gas Emissions), and 4.4 (Energy) and consistent with Appendix G of the CEQA Guidelines.

Table ES-1. Summary of Impact Determinations

Analysis	Report Section	Checklist Question	Significance Determinations	
			Unmitigated	Mitigated
Air Quality				
Would the project conflict with or obstruct implementation of the applicable air quality plan?	2.4.1	AQ-1	Significant	Significant and unavoidable
Would the project result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard?	2.4.2	AQ-2	Significant for construction Significant for operation	Significant and unavoidable for construction Significant and unavoidable for operation
Would the project expose sensitive receptors to substantial pollutant concentrations?	2.4.3	AQ-3	Less than significant for carbon monoxide hotspots Significant for health risk Significant for valley fever	Less than significant for carbon monoxide hotspots Significant and unavoidable for health risk Less than significant for valley fever
Would the project result in other emissions (such as those leading to odors) adversely affecting a substantial number of people?	2.4.4	AQ-4	Significant	Less than significant
Greenhouse Gas Emissions				
Would the project generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?	3.5.1	GHG-a1 and GHG-a2	Significant	Significant and unavoidable
Would the project conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of greenhouse gases?	3.5.2	GHG-2	Less than significant	Less than significant
Energy				
Would the project result in potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy resources, during project construction or operation?	4.4.1	Energy-1	Less than significant	Less than significant

Notes: AQ = air quality; GHG = greenhouse gases.

1 Introduction and Project Description

1.1 Report Purpose and Scope

The purpose of this technical report (report) is to assess the potential air quality, greenhouse gas (GHG) emissions, and energy impacts associated with implementation of the proposed Lithium Valley Specific Plan (LVSP) Project (LVSP or proposed project or project). This assessment uses the significance thresholds in Appendix G of the California Environmental Quality Act (CEQA) Guidelines (14 CCR 15000 et seq.) and is based on the emissions-based significance thresholds recommended by the Imperial County Air Pollution Control District (ICAPCD) and other applicable thresholds of significance.

This introductory chapter provides a description of the project and the project location. Chapter 2, Air Quality, describes the air-quality-related environmental setting, regulatory setting, existing air quality conditions, and thresholds of significance and analysis methodology, and presents an air quality impact analysis per Appendix G of the CEQA Guidelines. Chapter 3, Greenhouse Gas Emissions, describes the GHG-emissions-related environmental setting, regulatory setting, existing climate change conditions, and thresholds of significance and analysis methodology, and presents a GHG emissions impact analysis per Appendix G of the CEQA Guidelines. Chapter 4, Energy, similarly describes the energy-related environmental setting, regulatory setting, existing energy considerations, and thresholds of significance and analysis methodology, Chapter 5, References, includes a list of the references cited. Chapter 6, Preparers, includes a list of those who prepared this technical report.

1.2 Project Location

Imperial County, located in Southern California, lies to the east of San Diego County, west of the Arizona border, and north of the U.S.–Mexico border, which forms its southern boundary (see Figure 1, Vicinity Map). The proposed Specific Plan Area (Plan Area) is located in the northern portion of the County, bordering the Salton Sea. The Plan Area was designed to encompass a substantial portion of the Known Geothermal Resource Area (KGRA), but it excludes the unincorporated town of Niland and the City of Calipatria, as well as certain state- and federally owned lands within the Salton Sea.

The northern boundary of the Plan Area extends to include the railroad corridor, whereas the eastern boundary is marked by major transportation corridors, including State Route (SR) 111 and Gentry/Forrester Road, with close proximity to the north–south railroad line that runs parallel to SR-111. To the south, the Plan Area extends to reach the New River, further defining the project's spatial limits.

1.3 Existing Site Conditions

Imperial County has been characterized by extensive agricultural activities, with crop production and agricultural related industries a large employment sector. The County has a population of approximately 180,000 residents. The project is located near the Salton Sea, which is maintained by agricultural runoff from the Imperial and Coachella valleys. The Salton Sea supports an ecosystem that attracts hundreds of migratory bird species as a component of the Pacific Flyway, a major migratory route for birds traveling between North and South America, and supports a multitude of other wildlife. Elevated salinity levels and environmental toxins from reduced inflow and increased pollutants from the New River and Alamo River have led to a decline in fish and bird populations. This

area also includes much of the Salton Sea KGRA, which defines the availability of a resource attractive for geothermal energy development and lithium recovery.

The Salton Sea remains a focal point for future development of renewable energy and mineral recovery. The KGRA within the Plan Area offers excellent potential for the development of geothermal energy generation and lithium extraction, both of which are key to advancing renewable energy initiatives and supporting the growing electric vehicle (EV) industry. The Plan Area is located close to transportation infrastructure such as SR-111 and the Union Pacific railroad that may provide access for transporting materials, equipment, and products.

The Plan Area also consists of 10 geothermal power plants in the Salton Sea KGRA in the Imperial Valley. Five of the Imperial Valley facilities – Vulcan, Salton Sea 1, Elmore, Hoch, and Salton Sea 3 – deliver output to a consortium of customers (the City of Riverside, Salt River Project, Sacramento Municipal Utility District, and Imperial Irrigation District [IID]) under long-term portfolio arrangements that enable these customers to spread delivery risk over multiple plants. The remaining five plants deliver output to Southern California Edison (Leathers, Salton Sea 2, and Salton Sea 4), the city of Riverside (Salton Sea 5) and Arizona Public Service (CE Turbo). The combined capacity at Imperial Valley is approximately 345 net megawatts (MW).

1.4 Project Description

The LVSP aims to develop a Specific Plan in the northern portion of the Imperial Valley, specifically along the southeastern part of the Salton Sea, that plans for the continued development of renewable energy infrastructure and related industries including the extraction, processing, and manufacturing use of lithium to support the country's accelerated transition to clean energy.

The LVSP would guide implementation through the integration of a variety of land use designations and zoning codes. Buildout of the LVSP would result in a total approximate maximum buildout of 51,774,849 square feet of development within the 51,622-acre Plan Area (see Figure 2, Proposed Land Use Map). The full development is estimated to generate approximately 40,000 jobs inclusive of 10,000 construction jobs. Implementation of the LVSP would include phased development; expressed by phase, Phase 1 would include up to 24,718,111 square feet of development across approximately 25,521 acres; subsequently, Phases 2 and 3 would include up to 13,534,427 square feet of development across 13,662 acres and 8,759,333 square feet of development over 12,439 acres, respectively.

1.5 Lithium Valley Specific Plan Measures

Program HP-7: Equipment Exhaust Minimization. Within Goal 5: Community Health and Prosperity (HP) of the Lithium Valley Specific Plan, Program HP-7 requires all diesel-fueled off-road equipment shall meet EPA-rated Tier 4 Final engines consistent with Cal. Code Regs., tit. 13 § 2449 et seq. Electric or net-zero emissions equipment is preferred when commercially available and would also meet this requirement.

Policy HP-18 Dust Suppression. Within Goal 5: Community Health and Prosperity (HP) of the Lithium Valley Specific Plan, Policy HP-18 requires To demonstrate compliance with ICAPCD Rules 800-806, all construction activities within the Specific Plan Area must implement the following dust control measures at a minimum:

- Water the exposed area three times per 8-hour workday at a minimum
- Water demolished area two times per 8-hour workday at a minimum
- For on-road fugitive dust, water unpaved roads two times daily at a minimum
- Limit vehicle speeds on unpaved roads to 15 miles per hour
- Sweep paved roads one per month at a minimum
- Pave unpaved roads as soon as feasible during the construction process

Policy HP-19 Paved Roads. The County will ensure that all future development projects within the Plan Area are accessible by a paved road prior to providing a certificate of occupancy.

The following programs and policies would be implemented in the LVSP to enhance transit access and the connectivity of the LVSP with the County:

LVSP Section 5.5 Increased Bus Frequencies. The project tenants or individual employers shall coordinate with IVT to update bus service routes and service times to serve the project. The frequency of Imperial Valley Transit Route 2 will be significantly enhanced. On weekdays, service intervals will be reduced from the current 60-180 minutes to 15-30 minutes, while service internals on weekends will improve to 30-60 minutes. This increase is designed to provide more reliable and convenient transit options for residents and workers.

Dedicated Bus Lane on SR-111. The County, IVT, and project tenants shall coordinate with Caltrans for construction of a new outside lane, exclusive to buses, defined as a dedicated bus lane. This lane would significantly improve the reliability and timeliness of transit services, making public transportation a more attractive option for residents of the County.

Development of Transit Hubs. Transit Facilities, strategically located transit hubs will be established to facilitate seamless connectivity. These hubs will serve as essential nodes within the transit system. Transit or Mobility hub is a central place where multiple modes of transportation converge, designed to facilitate seamless transfers, improve accessibility, and reduce travel time for commuters.

- The locations of the hubs are intended to connect the communities of Niland and Calipatria with the employment hub in the heart of the Plan Area. Implementation of Transit Hub would require coordination with IVT, Imperial County and communities of Niland and Calipatria.
- Each transit hub will include designated spaces for park and ride lots, shared vehicles, and shuttles to employment centers, ensuring efficient transfers and accessibility for commuters. Transit Hubs should be supplemented with additional strategies or programs that provide increased public transit, bicycle, and pedestrian access and improvements. The Transit Hub is anticipated to strengthen the effectiveness of other proposed TDM [Transportation Demand Management] strategies.

Express Bus Connections. The County, IVT, and project tenants shall identify additional express bus routes that may be implemented based on the region's needs and demand and connect to the Plan Area. The express bus route shall consider stops at various locations within the northern communities inclusive of transit hubs and employment centers. This service will link workers to

their jobs, promote rideshare opportunities, provide further travel opportunities to the general public and reduce greenhouse gas emissions. Express routes will also connect Calipatria to SDSU [San Diego State University] Brawley Campus and Imperial Valley College, facilitating access to educational institutions and expanding opportunities for residents.

Employee Shuttle. An employee shuttle shall be implemented once there are three (3) employers with over 200 on-site employees, for a total of over 600 employees in the Plan Area. The employee shuttle would connect the transit hubs at Niland and Calipatria to the employment centers of over 200 on-site employees. This service would link workers to their jobs, promote rideshare opportunities and reduce greenhouse gas emissions.

The employee shuttle or express bus route may be funded and operated by one or more of the following: the newly established Lithium Valley Infrastructure Special District, the participating private employers, or ICTC [Imperial County Transportation Commission]. In collaboration with ICTC and SCAG [Southern California Association of Governments], Imperial County would also enhance transit safety and convenience by upgrading transit stops with shelters and real-time trip information systems. Improvements would be triggered based on operational needs and employment metrics, with a shuttle system introduced to connect employees to transit hubs and commercial destinations.

2 Air Quality

2.1 Environmental Setting

2.1.1 Climate and Meteorology

The primary factors that determine air quality are the locations of air pollutant sources and the amount of pollutants emitted. Meteorological and topographical conditions, however, are also important. Factors such as wind speed and direction, air temperature gradients and sunlight, and precipitation and humidity interact with physical landscape features to determine the movement and dispersal of air pollutants. The Salton Sea Air Basin (SSAB) air pollution problems are a consequence of the combination of the region's natural characteristics and the prevalence of human activity. Meteorological and topographical factors that affect air quality in the SSAB are described below.

Climate

The SSAB encompasses the entirety of Imperial County and the southeast portion of Riverside County and is generally an arid desert region, with a significant portion located below sea level. A semipermanent high-pressure cell blocks midlatitude storms and causes sunny skies most of the time. The SSAB is characterized by a hot desert climate, experiencing extremely hot summers and mild winters, with minimal rainfall. The SSAB lies in the arid Colorado Desert region of Southern California, which significantly influences its climate patterns. The climate in the SSAB is dominated by high temperatures and low humidity. Average summer temperatures often exceed 100°F, with some areas recording temperatures as high as 120°F. Winters are mild, with average temperatures ranging from 40°F to 70°F. The region receives very little precipitation, typically less than 3 inches annually. The SSAB contains relatively few major emissions sources, but may experience emissions from significant vehicular traffic, particularly near the two international port of entries. Emissions sources consist of geothermal power generation, food processing, plaster manufacturing, and other light industrial facilities. The dry, dusty conditions are exacerbated by the receding shoreline of the Salton Sea, which exposes sediments that are easily picked up by strong winds, contributing to emissions of particulate matter (PM) (PM_{10} [PM with an aerodynamic diameter less than or equal to 10 microns]). This dust pollution is a significant concern for local communities, particularly those that are socioeconomically disadvantaged. Humidity levels in the SSAB are generally low, but the presence of the Salton Sea can create localized areas of higher humidity. However, this effect is limited and does not significantly alter the overall arid conditions. The region experiences occasional strong winds, which can lead to dust storms and further degrade air quality. Overall, the SSAB's climate is characterized by extreme heat, low humidity, and minimal rainfall, with significant air quality challenges due to dust pollution from the exposed lakebed of the Salton Sea (Imperial County 2016).

Salton Sea Conditions

Spanning an area of over 300 square miles, the Salton Sea is California's largest lake and is a major driver or air quality conditions within the SSAB. At its formation, the Sea's water level lied at 195 feet below mean sea level and spanned 520 square miles (Pacific Institute 2025). A declining water supply, due to evaporation and an absence

of tributary inflow, has resulted in an increasingly saline and eutrophic[1] body of water. The agricultural runoff into the Sea from the surrounding region is responsible for its eutrophication, and, as the Sea continues to evaporate and recede, an increasing area of its shores, or playas, are exposed to the open air. The sand found on these beaches can present considerable air quality issues when strong winds pick up the exposed lakebed, creating dust storms carrying PM_{10} into the air (Setmire et al. 2000). Dust storms can reach up to more than 20 miles per hour wind speeds and cause power outages due to infrastructure damage (Valenzuela 2022). Increasing dust and potential toxic airborne emissions may lead to major environmental justice issues for the vulnerable population living nearby through increased asthma and respiratory illness (CNRA 2018a).

2.1.2 Pollutants and Effects

2.1.2.1 Criteria Air Pollutants

Criteria air pollutants are defined as pollutants for which the federal and state governments have established ambient air quality standards, or criteria, for outdoor concentrations to protect public health. The national and California standards have been set, with an adequate margin of safety, at levels above which concentrations could be harmful to human health and welfare. These standards are designed to protect the most sensitive persons from illness or discomfort. Pollutants of concern include ozone (O_3), nitrogen dioxide (NO_2), carbon monoxide (CO), sulfur dioxide (SO_2), PM_{10}, $PM_{2.5}$ (PM with an aerodynamic diameter less than or equal to 2.5 microns), and lead. In California, sulfates, vinyl chloride, hydrogen sulfide, and visibility-reducing particles are also regulated as criteria air pollutants. These pollutants, as well as TACs, are discussed in the following paragraphs.[2]

Ozone. O_3 is a strong-smelling, pale blue, reactive, toxic chemical gas consisting of three oxygen atoms. It is a secondary pollutant formed in the atmosphere by a photochemical process involving the sun's energy and O_3 precursors. These precursors are mainly oxides of nitrogen (NO_x) and volatile organic compounds (VOCs). The maximum effects of precursor emissions on O_3 concentrations usually occur several hours after they are emitted and many miles from the source. Meteorology and terrain play major roles in O_3 formation, and ideal conditions occur during summer and early autumn on days with low wind speeds or stagnant air, warm temperatures, and cloudless skies. O_3 exists in the upper atmosphere O_3 layer (stratospheric O_3) and at the Earth's surface in the troposphere (ground-level O_3).[3] The O_3 that the U.S. Environmental Protection Agency (EPA) and the California Air Resources Board (CARB) regulate as a criteria air pollutant is produced close to the ground level, where people live, exercise, and breathe. Ground-level O_3 is a harmful air pollutant that causes numerous adverse health effects and is thus considered "bad" O_3. Stratospheric, or "good," O_3 occurs naturally in the upper atmosphere, where it reduces the amount of ultraviolet light (i.e., solar radiation) entering the Earth's atmosphere. Without the protection of the beneficial stratospheric O_3 layer, plant and animal life would be seriously harmed.

O_3 in the troposphere causes numerous adverse health effects; short-term exposures (lasting for a few hours) to O_3 at levels typically observed in Southern California can result in breathing pattern changes, reduction of breathing

1 Eutrophic systems, like the Salton Sea, often face accelerated degradation due to nutrient-rich runoff, which typically includes fertilizers and pesticides from agricultural sources. This influx of nutrients creates ideal conditions for algal blooms and excessive plant growth, leading to hypoxic conditions that can harm local aquatic life, disrupting the ecosystem.

2 The descriptions of the criteria air pollutants and associated health effects are based on the U.S. Environmental Protection Agency (EPA) Criteria Air Pollutants (EPA 2025a) and the California Air Resources Board (CARB) Glossary (CARB 2025a).

3 The troposphere is the layer of the Earth's atmosphere nearest to the surface of the Earth. The troposphere extends outward about 5 miles at the poles and about 10 miles at the equator.

capacity, increased susceptibility to infections, inflammation of the lung tissue, and some immunological changes (EPA 2020).

Inhalation of O_3 causes inflammation and irritation of the tissues lining human airways, causing and worsening a variety of symptoms. Exposure to O_3 can reduce the volume of air that the lungs breathe in, thereby causing shortness of breath. O_3 in sufficient doses increases the permeability of lung cells, rendering them more susceptible to toxins and microorganisms. The occurrence and severity of health effects from O_3 exposure vary widely among individuals, even when the dose and the duration of exposure are the same. Research shows adults and children who spend more time outdoors participating in vigorous physical activities are at greater risk from the harmful health effects of O_3 exposure. Although there are relatively few studies on the effects of O_3 on children, the available studies show that children are no more or less likely to suffer harmful effects than adults. However, there are a number of reasons why children may be more susceptible to O_3 and other pollutants. Children and teens spend nearly twice as much time outdoors and engaged in vigorous activities as adults. Children breathe more rapidly than adults and inhale more pollution per pound of their body weight than adults. Also, children are less likely than adults to notice their own symptoms and avoid harmful exposures. Further research may be able to better distinguish between health effects in children and adults. Children, adolescents, and adults who exercise or work outdoors, where O_3 concentrations are the highest, are at the greatest risk of harm from this pollutant (CARB 2025b).

Nitrogen Dioxide. NO_2 is a brownish, highly reactive gas that is present in all urban atmospheres. The major mechanism for the formation of NO_2 in the atmosphere is the oxidation of the primary air pollutant nitric oxide, which is a colorless, odorless gas. NO_x plays a major role, together with VOCs, in the atmospheric reactions that produce O_3. NO_x is formed from fuel combustion under high temperature or pressure. In addition, NO_x is an important precursor to acid rain and may affect both terrestrial and aquatic ecosystems. The two major emissions sources are transportation and stationary fuel combustion sources such as electric utility and industrial boilers. NO_2 can irritate the lungs, cause bronchitis and pneumonia, and lower resistance to respiratory infections.

A large body of health science literature indicates that exposure to NO_2 can induce adverse health effects. The strongest health evidence, and the health basis for the ambient air quality standards for NO_2, results from controlled human exposure studies that show that NO_2 exposure can intensify responses to allergens in allergic asthmatics. In addition, a number of epidemiological studies have demonstrated associations between NO_2 exposure and premature death, cardiopulmonary effects, decreased lung function growth in children, respiratory symptoms, emergency room visits for asthma, and intensified allergic responses. Infants and children are particularly at risk because they have disproportionately higher exposure to NO_2 than adults due to their greater breathing rate for their body weight and their typically greater outdoor exposure duration. Several studies have shown that long-term NO_2 exposure during childhood, the period of rapid lung growth, can lead to smaller lungs at maturity in children with higher levels of exposure compared to children with lower exposure levels. In addition, children with asthma have a greater degree of airway responsiveness compared with adult asthmatics. In adults, the greatest risk is to people who have chronic respiratory diseases, such as asthma and chronic obstructive pulmonary disease (CARB 2025c).

Carbon Monoxide. CO is a colorless, odorless gas formed by the incomplete combustion of hydrocarbon, or fossil fuels. CO is emitted almost exclusively from motor vehicles, power plants, refineries, industrial boilers, ships, aircraft, and trains. In urban areas, automobile exhaust accounts for the majority of CO emissions. CO is a nonreactive air pollutant that dissipates relatively quickly. CO concentrations are influenced by local meteorological conditions—primarily wind speed, topography, and atmospheric stability. CO from motor vehicle exhaust can become locally concentrated when surface-based temperature inversions are combined with calm atmospheric

conditions, which is a typical situation at dusk in urban areas from November to February. The highest levels of CO typically occur during the colder months of the year, when inversion conditions are more frequent.

CO is harmful because it binds to hemoglobin in the blood, reducing the ability of blood to carry oxygen. This interferes with oxygen delivery to the body's organs. The most common effects of CO exposure are fatigue, headaches, confusion and reduced mental alertness, light-headedness, and dizziness due to inadequate oxygen delivery to the brain. For people with cardiovascular disease, short-term CO exposure can further reduce their body's already compromised ability to respond to the increased oxygen demands of exercise, exertion, or stress. Inadequate oxygen delivery to the heart muscle leads to chest pain and decreased exercise tolerance. Unborn babies whose mothers experience high levels of CO exposure during pregnancy are at risk of adverse developmental effects. Unborn babies, infants, elderly people, and people with anemia or with a history of heart or respiratory disease are most likely to experience health effects with exposure to elevated levels of CO (CARB 2025d).

Sulfur Dioxide. SO_2 is a colorless, pungent gas formed primarily from incomplete combustion of sulfur-containing fossil fuels. The main sources of SO_2 are coal and oil used in fossil fuel power plants and industries; as such, the highest levels of SO_2 are generally found near large industrial complexes. In recent years, SO_2 concentrations have been reduced by the increasingly stringent controls placed on stationary source emissions of SO_2 and limits on the sulfur content of fuels.

Controlled human exposure and epidemiological studies show that children and adults with asthma are more likely to experience adverse responses with SO_2 exposure, compared with the nonasthmatic population. Effects at levels near the 1-hour standard are those of asthma exacerbation, including bronchoconstriction accompanied by symptoms of respiratory irritation such as wheezing, shortness of breath, and chest tightness, especially during exercise or physical activity. Also, exposure at elevated levels of SO_2 (above 1 part per million [ppm]) results in increased incidence of pulmonary symptoms and disease, decreased pulmonary function, and increased risk of death. Older people and people with cardiovascular disease or chronic lung disease (such as bronchitis or emphysema) are most likely to experience these adverse effects (CARB 2025e).

SO_2 is of concern both because it is a direct respiratory irritant and because it contributes to the formation of sulfate and sulfuric acid in PM (NRC 2005). People with asthma are of particular concern, both because they have increased baseline airflow resistance and because their SO_2-induced increase in airflow resistance is greater than in healthy people, and it increases with the severity of their asthma (NRC 2005). SO_2 is thought to induce airway constriction via neural reflexes involving irritant receptors in the airways (NRC 2005).

Particulate Matter. PM pollution consists of very small liquid and solid particles floating in the air, which can include smoke, soot, dust, salts, acids, and metals. PM can form when gases emitted from industries and motor vehicles undergo chemical reactions in the atmosphere. $PM_{2.5}$ and PM_{10} represent fractions of PM. Coarse PM (PM_{10}) consists of PM that is 10 microns or less in diameter, which is about 1/7 the thickness of a human hair. Major sources of PM_{10} include crushing or grinding operations; dust stirred up by vehicles traveling on roads; wood-burning stoves and fireplaces; dust from construction, landfills, and agriculture; wildfires and brush/waste burning; industrial sources; windblown dust from open lands; and atmospheric chemical and photochemical reactions. Fine PM ($PM_{2.5}$) consists of PM that is 2.5 microns or less in diameter, which is roughly 1/28 the diameter of a human hair. $PM_{2.5}$ results from fuel combustion (e.g., from motor vehicles and power generation and industrial facilities), residential fireplaces, and woodstoves. In addition, $PM_{2.5}$ can be formed in the atmosphere from gases such as sulfur oxides (SO_x), NO_x, and VOCs.

When inhaled, these tiny particles can penetrate the human respiratory system's natural defenses and damage the respiratory tract. $PM_{2.5}$ and PM_{10} can increase the number and severity of asthma attacks, cause or aggravate bronchitis and other lung diseases, and reduce the body's ability to fight infections. Very small particles of substances such as lead, sulfates, and nitrates can cause lung damage directly or be absorbed into the bloodstream, causing damage elsewhere in the body. Additionally, these substances can transport adsorbed gases such as chlorides or ammonium into the lungs, also causing injury. Whereas PM_{10} tends to collect in the upper portion of the respiratory system, $PM_{2.5}$ is so tiny that it can penetrate deeper into the lungs and damage lung tissue. Suspended particulates also damage and discolor surfaces on which they settle and produce haze and reduce regional visibility.

Several adverse health effects have been associated with exposure to both $PM_{2.5}$ and PM_{10}. For $PM_{2.5}$, short-term exposures (up to 24 hours duration) have been associated with premature death, increased hospital admissions for heart or lung causes, acute and chronic bronchitis, asthma attacks, emergency room visits, respiratory symptoms, and restricted activity days. These adverse health effects have been reported primarily in infants, children, and older adults with preexisting heart or lung diseases. In addition, of all of the common air pollutants, $PM_{2.5}$ is associated with the greatest proportion of adverse health effects related to air pollution, both in the United States and worldwide based on the World Health Organization's Global Burden of Disease Project. Short-term exposures to PM_{10} have been associated primarily with worsening of respiratory diseases, including asthma and chronic obstructive pulmonary disease, leading to hospitalization and emergency department visits (CARB 2025f).

Long-term exposure (months to years) to $PM_{2.5}$ has been linked to premature death, particularly in people who have chronic heart or lung diseases, and reduced lung function growth in children. The effects of long-term exposure to PM_{10} are less clear, although several studies suggest a link between long-term PM_{10} exposure and respiratory death. The International Agency for Research on Cancer published a review in 2015 that concluded that PM in outdoor air pollution causes lung cancer (CARB 2025f).

Lead. Lead in the atmosphere occurs as PM. Sources of lead include leaded gasoline; the manufacturing of batteries, paints, ink, ceramics, and ammunition; and secondary lead smelters. Prior to 1978, mobile emissions were the primary source of atmospheric lead. Between 1978 and 1987, the phaseout of leaded gasoline reduced the overall inventory of airborne lead by nearly 95%. With the phaseout of leaded gasoline, secondary lead smelters, battery recycling, and manufacturing facilities are becoming lead-emissions sources of greater concern. As gasoline no longer contains lead, the project is not anticipated to result in impacts related to lead; therefore, it is not discussed in this analysis.

Prolonged exposure to atmospheric lead poses a serious threat to human health. Health effects associated with exposure to lead include gastrointestinal disturbances, anemia, kidney disease, and in severe cases, neuromuscular and neurological dysfunction. Of particular concern are low-level lead exposures during infancy and childhood. Such exposures are associated with decrements in neurobehavioral performance, including IQ performance, psychomotor performance, reaction time, and growth. Children are highly susceptible to the effects of lead.

Sulfates. Sulfates are the fully oxidized form of sulfur, which typically occur in combination with metals or hydrogen ions. Sulfates are produced from reactions of SO_2 in the atmosphere and can result in respiratory impairment, as well as reduced visibility.

Vinyl Chloride. Vinyl chloride is a colorless gas with a mild, sweet odor, which has been detected near landfills, sewage plants, and hazardous waste sites, due to the microbial breakdown of chlorinated solvents. Short-term exposure to high levels of vinyl chloride in the air can cause nervous system effects, such as dizziness, drowsiness, and headaches. Long-term exposure through inhalation can cause liver damage, including liver cancer.

Hydrogen Sulfide. Hydrogen sulfide is a colorless and flammable gas that has a characteristic odor of rotten eggs. Sources of hydrogen sulfide include geothermal power plants, petroleum refineries, sewers, and sewage treatment plants. Exposure to hydrogen sulfide can result in nuisance odors, as well as headaches and breathing difficulties at higher concentrations. Hydrogen sulfide is formed by organic decay in the absence of oxygen at the bottom of the Salton Sea. Hydrogen sulfide emissions from the Salton Sea are more intense and frequent during warmer months when decaying organic matter releases elevated concentrations of the gas.

Visibility-Reducing Particles. Visibility-reducing particles are any particles in the air that obstruct the range of visibility. Effects of reduced visibility can include obscuring the viewshed of natural scenery, reducing airport safety, and discouraging tourism. Sources of visibility-reducing particles are the same as for $PM_{2.5}$.

Volatile Organic Compounds. Hydrocarbons are organic gases that are formed from hydrogen and carbon and sometimes other elements. Hydrocarbons that contribute to formation of O_3 are referred to and regulated as VOCs (also referred to as reactive organic gases). Combustion engine exhaust, oil refineries, and fossil-fueled power plants are sources of hydrocarbons. Other sources of hydrocarbons include evaporation from petroleum fuels, solvents, dry cleaning solutions, and paint.

The primary health effects of VOCs result from the formation of O_3 and its related health effects. High levels of VOCs in the atmosphere can interfere with oxygen intake by reducing the amount of available oxygen through displacement. Carcinogenic forms of hydrocarbons, such as benzene, are considered TACs. There are no separate ambient air quality standards for VOCs as a group.

2.1.2.2 Noncriteria Air Pollutants

Toxic Air Contaminants. A substance is considered toxic if it has the potential to cause adverse health effects in humans, including increasing the risk of cancer upon exposure, or acute and/or chronic noncancer health effects. A toxic substance released into the air is considered a TAC. TACs are identified by federal and state agencies based on a review of available scientific evidence. In California, TACs are identified through a two-step process that was established in 1983 under the Toxic Air Contaminant Identification and Control Act. This two-step process of risk identification and risk management and reduction was designed to protect residents from the health effects of toxic substances in the air. In addition, the California Air Toxics "Hot Spots" Information and Assessment Act, Assembly Bill (AB) 2588, was enacted by the California State Legislature in 1987 to address public concern over the release of TACs into the atmosphere. The law requires facilities emitting toxic substances to provide local air pollution control districts with information that will allow an assessment of the air toxics problem, identification of air toxics emissions sources, location of resulting hotspots, notification of the public exposed to significant risk, and development of effective strategies to reduce potential risks to the public over 5 years.

Examples include certain aromatic and chlorinated hydrocarbons, certain metals, and asbestos. TACs are generated by a number of sources, including stationary sources, such as dry cleaners, gas stations, combustion sources, and laboratories; mobile sources, such as automobiles; and area sources, such as landfills. Adverse health effects associated with exposure to TACs may include carcinogenic (i.e., cancer-causing) and noncarcinogenic

effects. Noncarcinogenic effects typically affect one or more target organ systems and may be experienced on either short-term (acute) or long-term (chronic) exposure to a given TAC.

CARB classified "particulate emissions from diesel-fueled engines" (i.e., diesel particulate matter [DPM]) (17 CCR 93000) as a TAC in August 1998. DPM is part of a complex mixture that makes up diesel exhaust. Diesel exhaust is composed of two phases, gas and particle, both of which contribute to health risks. More than 90% of DPM is less than 1 micrometer in diameter (about 1/70 the diameter of a human hair), and thus is a subset of $PM_{2.5}$ (CARB 2025f). DPM is typically composed of carbon particles ("soot," also called black carbon) and numerous organic compounds, including over 40 known cancer-causing organic substances. Examples of these chemicals include polycyclic aromatic hydrocarbons, benzene, formaldehyde, acetaldehyde, acrolein, and 1,3-butadiene (CARB 2025f). DPM is emitted from a broad range of diesel engines: on-road diesel engines, including trucks, buses, and cars, and off-road diesel engines, including locomotives, marine vessels, and heavy-duty construction equipment, among others. Approximately 70% of all airborne cancer risk in California is associated with DPM (CARB 2000). To reduce the cancer risk associated with DPM, CARB adopted a diesel risk reduction plan in 2000 (CARB 2000). Because it is part of $PM_{2.5}$, DPM also contributes to the same noncancer health effects as $PM_{2.5}$ exposure. These effects include premature death; hospitalizations and emergency department visits for exacerbated chronic heart and lung disease, including asthma; increased respiratory symptoms; and decreased lung function in children. Several studies suggest that exposure to DPM may also facilitate development of new allergies (CARB 2025f). Those most vulnerable to noncancer health effects are children, whose lungs are still developing, and older people, who often have chronic health problems.

Odorous Compounds. Odors are generally regarded as an annoyance rather than a health hazard. Manifestations of a person's reaction to odors can range from psychological (e.g., irritation, anger, or anxiety) to physiological (e.g., circulatory and respiratory effects, nausea, vomiting, and headache). The ability to detect odors varies considerably among the population and overall is quite subjective. People may have different reactions to the same odor. An odor that is offensive to one person may be perfectly acceptable to another (e.g., coffee roaster). An unfamiliar odor is more easily detected and is more likely to cause complaints than a familiar one. In a phenomenon known as odor fatigue, a person can become desensitized to almost any odor, and recognition may only occur with an alteration in the intensity. The occurrence and severity of odor impacts depend on the nature, frequency, and intensity of the source; wind speed and direction; and the sensitivity of receptors.

Valley Fever. Coccidioidomycosis, more commonly known as "valley fever," is an infection caused by inhalation of the spores of the *Coccidioides immitis* fungus, which grows in the soils of the southwestern United States. The fungus is very prevalent in the soils of California's San Joaquin Valley, particularly in Kern County. The ecologic factors that appear to be most conducive to survival and replication of the spores are high summer temperatures, mild winters, sparse rainfall, and alkaline, sandy soils.

Imperial County is not considered a highly endemic county (i.e., highly endemic meaning more than 20 cases annually of valley fever per 100,000 people) based on the incidence rates reported through 2023. The latest report from the California Department of Public Health indicates that Imperial County had 21 cases in 2023, or 11.7 cases per 100,000 people (CDPH 2024a). The California counties with the highest incidences for valley fever include Kern (330.9 per 100,000), Kings (176.6 per 100,000), Tulare (94.7 per 100,000), San Luis Obispo (84.7 per 100,000), Fresno (55.8 per 100,000), and San Joaquin (44.4 per 100,000), which together accounted for 49% of the reported cases in 2023 (CDPH 2024a).

Playa Dust. Dust from the Salton Sea's exposed playa beds presents a environmental and public health concern in the region, including the Plan Area. The recession of the Salton Sea's water levels has exacerbated the issue, as more playa dust has been exposed and susceptible to becoming airborne. The main concern with the exposed playa's dust composition is the degree to which contaminants like salt, pesticides, selenium, and other metals in the soil and sediment will also be present in the playa dust (Vogl and Henry 2002; Frie et al. 2017). Elevated levels of these metals have been observed in Salton Sea soil sediments, and their accumulation in playa environments can increase the toxicity of PM and exacerbate related health risks. (Frie et al. 2017; Reheis et al. 2009; Breit et al. 2009).

To evaluate this health risk, the composition of playa dust and sediment and whether it is unique from native desert material has been the focus of multiple investigations (Vogl and Henry 2002; Xu et al. 2016; Frie et al. 2017, 2019; Biddle et al. 2023) as well as the IID Salton Sea Air Quality Mitigation Program (IID 2016). Specifically, IID has collected numerous samples of PM_{10} across seven playa and six desert sites and analyzed them for a suite of 51 elemental compounds.

Findings of the IID research indicate that concentrations of toxic metals are either below detection limits or similar to background soil conditions in the surrounding desert (IID 2024). The playa surfaces, originally dried Salton Sea sediment, are now vulnerable to wind erosion and spreading. Over time, they have formed salt crusts due to the evaporation of shallow groundwater, the creation of evaporite minerals, and the deposition of desert sediment by wind and water. These factors likely explain the discrepancy between the toxic elements observed in Salton Sea soil sediment and the lack thereof observed in playa and desert PM and soil samples.

Current research does not support the idea that playa dust (PM_{10}) is exceptionally high in toxic metals (IID 2024). However, the playa is an anthropogenic source of atmospheric dust, expected to increase in area and expose previously submerged Salton Sea sediment with potentially elevated contaminant levels. As the playa area expands, some of these sediments may be exposed, but deeper portions of the Salton Sea, which contain more concentrated contaminants, are expected to remain submerged (Anderson et al. 2008; Vogl and Henry 2002). As described in Section 2.1.1, exposures to PM_{10} and $PM_{2.5}$ have been associated with premature death, increased hospital admissions for heart or lung causes, worsening of respiratory diseases including asthma and chronic obstructive pulmonary disease, acute and chronic bronchitis, asthma attacks, and emergency room visits.

2.1.3 Sensitive Receptors

Some land uses are considered more sensitive to changes in air quality than others, depending on the population groups and the activities involved. People most likely to be affected by air pollution include children, the elderly, athletes, and people with cardiovascular and chronic respiratory diseases. Facilities and structures where these air-pollution-sensitive people live or spend considerable amounts of time are known as sensitive receptors. Land uses where air-pollution-sensitive individuals are most likely to spend time include schools and schoolyards, parks and playgrounds, daycare centers, nursing homes, hospitals, and residential communities (sensitive sites or sensitive land uses) (CARB 2005). The ICAPCD does not provide a definition for sensitive receptors; however, nearby air districts have established such definitions that are consistent with each other. For example, the Mojave Desert Air Quality Management District identifies sensitive receptors as residences, schools, daycare centers, playgrounds, and medical facilities. In addition, the South Coast Air Quality Management District (SCAQMD) identifies sensitive receptors as residences, schools, playgrounds, childcare centers, long-term healthcare facilities, rehabilitation centers, convalescent centers, and retirement homes (SCAQMD 1993).

The nearest sensitive receptors are existing single-family residences, located both within and adjacent to the project's boundaries and under the jurisdiction of the County and the City of Calipatria. These existing sensitive receptors represent the nearest land uses to the project. Figure 3, shows a map of nearby existing receptors within and adjacent to the project's boundaries.

The project itself would create sensitive receptors in the form of new temporary housing and permanent housing. CARB identifies sources of air pollution that are of primary concern to the siting of new sensitive receptors. Those sources include freeways, high traffic roadways, distribution centers, and large stationary sources, among others (CARB 2005). The northern boundary of the Plan Area extends to include the railroad corridor, whereas the eastern boundary is marked by major transportation corridors, including SR-111 and Gentry/Forrester Road, with close proximity to the north–south railroad line that runs parallel to SR-111. The existing roadway segments currently operate below the roadway capacity (RICK Engineering 2025).

2.1.4 Background Conditions

CalEnviroScreen, Senate Bill 535, Assembly Bill 1550, and Assembly Bill 617

CalEnviroScreen is a mapping tool that helps identify California communities that are most affected by many sources of pollution, where people are often especially vulnerable to pollution's effects. CalEnviroScreen ranks census tracts in California based on potential exposures to pollutants, adverse environmental conditions, socioeconomic factors, and the prevalence of certain health conditions. Data used in the CalEnviroScreen model come from national and state sources.

The Plan Area is located within an area that has been designated as a disadvantaged community pursuant to Senate Bill (SB) 535 (OEHHA 2022a), and as a Low-Income Community pursuant to AB 1550 (CARB 2025g). Furthermore, the Plan Area is located in an area designated for a Community Air Protection Program pursuant to AB 617 with portions located within the Westmorland, Brawley, and Calipatria-North End Phase 1 AB 617 Community (CARB 2025h). As such, the community must implement a Community Emissions Reduction Program (CERP) to address its air quality issues, including the burden of high cumulative exposure to pollutants.

The project site achieves a score of 82 on CalEnviroScreen (OEHHA 2021). The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state. Notably, the tract in which the project site is located is in the 91st percentile of pollution burden for 'pesticides,' 93rd percentile for 'hazardous waste,' and 100th percentile for 'impaired water' (OEHHA 2021), among other pollution categories.

Healthy Places Index

The Healthy Places Index (HPI) is a project of the Public Health Alliance of Southern California. The HPI is a powerful and easy-to-use data and policy platform created to advance health equity through open and accessible data. Neighborhood-by-neighborhood, the HPI maps data on social conditions that drive health—like education, job opportunities, clean air and water, and other indicators that are positively associated with life expectancy at birth. Community leaders, policymakers, academics, and other stakeholders use the HPI to compare the health and well-being of communities, identify health inequities and quantify the factors that shape health.

The project site has an HPI score of 3.7 (California Healthy Places Index 2022). The maximum HPI score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

2.2 Regulatory Setting

2.2.1 Federal Regulations

2.2.1.1 Criteria Air Pollutants

The federal Clean Air Act, passed in 1970 and last amended in 1990, forms the basis for the national air pollution control effort. EPA is responsible for implementing most aspects of the Clean Air Act, including setting National Ambient Air Quality Standards (NAAQS) for major air pollutants; setting hazardous air pollutant (HAP) standards; approving state attainment plans; setting motor vehicle emission standards; issuing stationary source emission standards and permits; and establishing acid rain control measures, stratospheric O_3 protection measures, and enforcement provisions. Under the Clean Air Act, NAAQS are established for the following criteria pollutants: O_3, CO, NO_2, SO_2, PM_{10}, $PM_{2.5}$, and lead.

The NAAQS describe acceptable air quality conditions designed to protect the health and welfare of the citizens of the nation. The NAAQS (other than for O_3, NO_2, SO_2, PM_{10}, $PM_{2.5}$, and those based on annual averages or arithmetic mean) are not to be exceeded more than once per year. NAAQS for O_3, NO_2, SO_2, PM_{10}, and $PM_{2.5}$ are based on statistical calculations over 1- to 3-year periods, depending on the pollutant. The Clean Air Act requires the EPA to reassess the NAAQS at least every 5 years to determine whether adopted standards are adequate to protect public health based on current scientific evidence. States with areas that exceed the NAAQS must prepare a State Implementation Plan (SIP) that demonstrates how those areas will attain the NAAQS within mandated time frames.

2.2.1.2 Hazardous Air Pollutants

The 1977 federal Clean Air Act amendments required the EPA to identify national emission standards for HAPs to protect public health and welfare. HAPs include certain volatile organic chemicals, pesticides, herbicides, and radionuclides that present a tangible hazard, based on scientific studies of exposure to humans and other mammals. Under the 1990 federal Clean Air Act amendments, which expanded the control program for HAPs, 187 substances and chemical families were identified as HAPs.

2.2.2 State Regulations

2.2.2.1 Criteria Air Pollutants

The federal Clean Air Act delegates the regulation of air pollution control and the enforcement of the NAAQS to the states. In California, the task of air quality management and regulation has been legislatively granted to CARB, with subsidiary responsibilities assigned to air quality management districts and air pollution control districts at the regional and county levels. CARB, which became part of the California Environmental Protection Agency in 1991, is responsible for ensuring implementation of the California Clean Air Act of 1988, responding to the federal Clean Air Act, and regulating emissions from motor vehicles and consumer products.

CARB has established California Ambient Air Quality Standards (CAAQS), which are generally more restrictive than the NAAQS. As stated previously, an ambient air quality standard defines the maximum amount of a pollutant averaged over a specified period of time that can be present in outdoor air without harm to the public's health. For each pollutant, concentrations must be below the relevant CAAQS before a basin can attain the corresponding

CAAQS. Air quality is considered "in attainment" if pollutant levels are continuously below the CAAQS and violate the standards no more than once each year. The CAAQS for O_3, CO, SO_2 (1-hour and 24-hour), NO_2, PM_{10}, and $PM_{2.5}$ and visibility-reducing particles are values that are not to be exceeded.

California air districts have based their thresholds of significance for CEQA purposes on the levels that scientific and factual data demonstrate that the air basin can accommodate without affecting the attainment date for the NAAQS or CAAQS. Because an ambient air quality standard is based on maximum pollutant levels in outdoor air that would not harm the public's health, and air district thresholds pertain to attainment of the ambient air quality standard, this means that the thresholds established by air districts are also protective of human health. The NAAQS and CAAQS are presented in Table 2-1.

Table 2-1. Ambient Air Quality Standards

Pollutant	Averaging Time	California Standards[a]	National Standards[b]	
		Concentration[c]	Primary[c,d]	Secondary[c,e]
O_3	1 hour	0.09 ppm (180 µg/m³)	—	Same as primary standard[f]
	8 hours	0.070 ppm (137 µg/m³)	0.070 ppm (137 µg/m³)[f]	
NO_2[g]	1 hour	0.18 ppm (339 µg/m³)	0.100 ppm (188 µg/m³)	Same as primary standard
	Annual arithmetic mean	0.030 ppm (57 µg/m³)	0.053 ppm (100 µg/m³)	
CO	1 hour	20 ppm (23 mg/m³)	35 ppm (40 mg/m³)	None
	8 hours	9.0 ppm (10 mg/m³)	9 ppm (10 mg/m³)	
SO_2[h]	1 hour	0.25 ppm (655 µg/m³)	0.075 ppm (196 µg/m³)	—
	3 hours	—	—	0.5 ppm (1,300 µg/m³)
	24 hours	0.04 ppm (105 µg/m³)	0.14 ppm (for certain areas)[g]	—
	Annual	—	0.030 ppm (for certain areas)[g]	—
PM_{10}[i]	24 hours	50 µg/m³	150 µg/m³	Same as primary standard
	Annual arithmetic mean	20 µg/m³	—	
$PM_{2.5}$[i]	24 hours	—	35 µg/m³	Same as primary standard
	Annual arithmetic mean	12 µg/m³	9.0 µg/m³	15.0 µg/m³
Lead[j,k]	30-day average	1.5 µg/m³	—	—
	Calendar quarter	—	1.5 µg/m³ (for certain areas)[k]	Same as primary standard
	Rolling 3-month average	—	0.15 µg/m³	
Hydrogen sulfide	1 hour	0.03 ppm (42 µg/m³)	—	—

Table 2-1. Ambient Air Quality Standards

Pollutant	Averaging Time	California Standards[a]	National Standards[b]	
		Concentration[c]	Primary[c,d]	Secondary[c,e]
Vinyl chloride[j]	24 hours	0.01 ppm (26 µg/m³)	—	—
Sulfates	24 hours	25 µg/m³	—	—
Visibility-reducing particles	8 hours (10:00 a.m. to 6:00 p.m. PST)	Insufficient amount to produce an extinction coefficient of 0.23 per kilometer due to the number of particles when the relative humidity is less than 70%	—	—

Source: CARB 2024.

Notes: O_3 = ozone; ppm = parts per million by volume; µg/m³ = micrograms per cubic meter; NO_2 = nitrogen dioxide; CO = carbon monoxide; mg/m³= milligrams per cubic meter; SO_2 = sulfur dioxide; PM_{10} = coarse particulate matter; $PM_{2.5}$ = fine particulate matter; PST = Pacific Standard Time.

a California standards for O_3, CO, SO_2 (1-hour and 24-hour), NO_2, suspended particulate matter (PM_{10}, $PM_{2.5}$), and visibility-reducing particles are values that are not to be exceeded. All others are not to be equaled or exceeded. CAAQS are listed in the Table of Standards in Section 70200 of Title 17 of the California Code of Regulations.

b National standards (other than O_3, NO_2, SO_2, particulate matter, and those based on annual averages or annual arithmetic mean) are not to be exceeded more than once per year. The O_3 standard is attained when the fourth-highest 8-hour concentration measured at each site in a year, averaged over 3 years, is equal to or less than the standard. For PM_{10}, the 24-hour standard is attained when the expected number of days per calendar year with a 24-hour average concentration above 150 µg/m³ is equal to or less than 1. For $PM_{2.5}$, the 24-hour standard is attained when 98% of the daily concentrations, averaged over 3 years, are equal to or less than the standard.

c Concentration expressed first in units in which it was promulgated. Equivalent units given in parentheses are based on a reference temperature of 25°C and a reference pressure of 760 torr. Most measurements of air quality are to be corrected to a reference temperature of 25°C and a reference pressure of 760 torr; ppm in this table refers to ppm by volume, or micromoles of pollutant per mole of gas.

d National primary standards: The levels of air quality necessary, with an adequate margin of safety, to protect the public health.

e National secondary standards: The levels of air quality necessary to protect the public welfare from any known or anticipated adverse effects of a pollutant.

f On October 1, 2015, the national 8-hour O_3 primary and secondary standards were lowered from 0.075 to 0.070 ppm.

g To attain the national 1-hour standard, the 3-year average of the annual 98th percentile of the 1-hour daily maximum concentrations at each site must not exceed 100 parts per billion (ppb). Note that the national 1-hour standard is in units of ppb. California standards are in units of ppm. To directly compare the national 1-hour standard to the California standards, the units can be converted from ppb to ppm. In this case, the national standard of 100 ppb is identical to 0.100 ppm.

h On June 2, 2010, a new 1-hour SO_2 standard was established, and the existing 24-hour and annual primary standards were revoked. To attain the national 1-hour standard, the 3-year average of the annual 99th percentile of the 1-hour daily maximum concentrations at each site must not exceed 75 ppb. The 1971 SO_2 national standards (24-hour and annual) remain in effect until 1 year after an area is designated for the 2010 standard, except that in areas designated nonattainment of the 1971 standards, the 1971 standards remain in effect until implementation plans to attain or maintain the 2010 standards are approved.

l On February 7, 2024, the national annual $PM_{2.5}$ primary standard was lowered from 12.0 µg/m³ to 9.0 µg/m³. The existing national 24-hour $PM_{2.5}$ standards (primary and secondary) were retained at 35 µg/m³, as was the annual secondary standard of 15 µg/m³. The existing 24-hour PM_{10} standards (primary and secondary) of 150 µg/m³ were also retained. The form of the annual primary and secondary standards is the annual mean averaged over 3 years.

j CARB has identified lead and vinyl chloride as TACs with no threshold level of exposure for adverse health effects determined. These actions allow for the implementation of control measures at levels below the ambient concentrations specified for these pollutants.

k The national standard for lead was revised on October 15, 2008, to a rolling 3-month average. The 1978 lead standard (1.5-µg/m³ as a quarterly average) remains in effect until 1 year after an area is designated for the 2008 standard, except that in areas designated nonattainment for the 1978 standard, the 1978 standard remains in effect until implementation plans to attain or maintain the 2008 standard are approved.

Local Ambient Air Quality

CARB, air districts, and other agencies monitor ambient air quality at approximately 250 air quality monitoring stations across the state. ICAPCD monitors local ambient air quality in the vicinity of the Plan Area. Air quality monitoring stations usually measure pollutant concentrations 10 feet above ground level; therefore, air quality is often referred to in terms of ground-level concentrations. The most recent background ambient air quality data from 2022 to 2024 are presented in Table 2-2. Local ambient air quality data was collected from four different sites to comprise the concentrations below. For concentrations of O_3 and PM_{10}, the Niland monitoring station, located within the Plan Area, was used. For concentrations of NO_2, data from the El Centro monitoring station, located approximately 21 miles from the Plan Area, was used. Data from the Brawley monitoring station, located approximately 9 miles from the Plan Area, was used for concentrations of $PM_{2.5}$. For CO and SO_2, data from the Calexico High School monitoring station, located approximately 30 miles from the Plan Area, was used. The data collected at these stations are considered representative of the air quality experienced in the Plan Area. The number of days exceeding the ambient air quality standards is also shown in Table 2-2.

Table 2-2. Local Ambient Air Quality Data

Averaging Time	Unit	Agency/ Method	Ambient Air Quality Standard	Measured Concentration by Year			Exceedances by Year		
				2022	2023	2024	2022	2023	2024

Sources: CARB 2025i; EPA 2025b. Monitoring station represented for each source noted in parentheses following the pollutant monitored.

Notes: ppm = parts per million by volume; — = not available; µg/m³ = micrograms per cubic meter; ND = insufficient data available to determine the value.

Niland-English Road Station is located at 7711 English Road, Niland, California.

El Centro-9th Street Station is located at 150 9th Street, El Centro, California.

Calexico High School Station is located at 1029 Ethel Street, Calexico, California.

Brawley-Main Street Station is located at 220 Main Street, Suite 204, Brawley, California.

Mecca-65705 Johnson Street Station is located at 65705 Johnson Street, Mecca, California 92254

Data taken from CARB iADAM (CARB 2025i) and EPA Outdoor Air Quality Data Monitor Values Report (EPA 2025b) represent the highest concentrations experienced over a given year.

Exceedances of national and California standards are only shown for O_3 and particulate matter. Daily exceedances for particulate matter are estimated days because PM_{10} and $PM_{2.5}$ are not monitored daily. All other criteria pollutants did not exceed national or California standards during the years shown. There is no national standard for 1-hour O_3, annual PM_{10}, or 24-hour SO_2, nor is there a California 24-hour standard for $PM_{2.5}$.

[a] Measurements of PM_{10} and $PM_{2.5}$ are usually collected every 6 days and every 1 to 3 days, respectively. Number of days exceeding the standards is a mathematical estimate of the number of days concentrations would have been greater than the level of the standard had each day been monitored. The numbers in parentheses are the measured number of samples that exceeded the standard.

Salton Sea Air Basin Attainment Designation

Pursuant to the 1990 federal Clean Air Act amendments, EPA classifies air basins (or portions thereof) as "attainment" or "nonattainment" for each criteria air pollutant based on whether the NAAQS have been achieved. Generally, if the recorded concentrations of a pollutant are lower than the standard, the area is classified as "attainment" for that pollutant. If an area exceeds the standard, the area is classified as "nonattainment" for that pollutant. If there is not enough data available to determine whether the standard is exceeded in an area, the area is designated as "unclassified" or "unclassifiable." The designation of "unclassifiable/attainment" means that the area meets the standard or is expected to be meet the standard despite a lack of monitoring data. Areas that achieve the standards after a nonattainment designation are re-designated as maintenance areas and must have approved maintenance plans to ensure continued attainment of the standards. The California Clean Air Act, like its federal counterpart, called for the designation of areas as "attainment" or "nonattainment," but based on CAAQS rather than the NAAQS. Table 2-3 depicts the current attainment status of the SSAB with respect to the NAAQS and CAAQS.

Table 2-3. Salton Sea Air Basin Attainment Classification

Pollutant	Designation/Classification	
	NAAQS	CAAQS
Ozone (O_3), 1-hour	No NAAQS	**Nonattainment**
Ozone (O_3), 8-hour	**Nonattainment–marginal**	**Nonattainment**
Nitrogen dioxide (NO_2)	Unclassifiable/attainment	Attainment
Carbon monoxide (CO)	Unclassifiable/attainment	Attainment
Sulfur dioxide (SO_2)	Unclassifiable/attainment	Attainment
Coarse particulate matter (PM_{10})	Attainment/maintenance	**Nonattainment**
Fine particulate matter ($PM_{2.5}$)	Attainment[a]	Attainment
Lead	Unclassifiable/attainment	Attainment
Hydrogen sulfide	No NAAQS	Unclassified
Sulfates	No NAAQS	Attainment
Visibility-reducing particles	No NAAQS	Unclassified
Vinyl chloride	No NAAQS	No designation

Sources: EPA 2025c (national); CARB 2025j (California).
Notes: Bold text = not in attainment; attainment = meets the standards; attainment/maintenance = achieves the standards after a nonattainment designation; nonattainment = does not meet the standards; unclassified or unclassifiable = insufficient data to classify; unclassifiable/attainment = meets the standard or is expected to be meet the standard despite a lack of monitoring data.

[a] A portion of Imperial County, within the Salton Sea Air Basin area, is designated as nonattainment for PM2.5; however, this area does not include the Plan Area. Therefore, the area is designated as attainment.

In summary, the SSAB is designated as a nonattainment area for federal and state O_3 standards. The SSAB is also designated as a nonattainment area for the state PM_{10} standards. The SSAB is designated as unclassified or in attainment for all other criteria air pollutants.

Despite the current nonattainment status, air quality in the SSAB has generally improved since the inception of air pollutant monitoring in 1976. This improvement is mainly a result of lower-polluting on-road motor vehicles, more stringent regulation of industrial sources, and the implementation of emission reduction strategies by ICAPCD. This

trend toward cleaner air has occurred despite continued population growth (ICAPCD 2017a; ICAPCD 2018a; ICAPCD 2018b).

Other Applicable Regulations

Other applicable regulations include the following, which are discussed in Section 2.2.2, State Regulations:

- California Building Standards (Title 24, CALGreen)
- SB 1078, Executive Order (EO)-14-08, SBX1-2, SB 350, SB 100, SB 1020 (Renewable Energy Sources)
- AB 1493 and EO B-16-12
- Advanced Clean Cars Program
- Advanced Clean Trucks Program
    - Truck and Bus Regulation, On-Road Heavy-Duty Diesel Vehicles (In-use) Regulation

2.2.2.2 Toxic Air Contaminants

The state Air Toxics Program was established in 1983 under AB 1807 (Tanner). The California TAC list identifies more than 200 pollutants, of which carcinogenic and noncarcinogenic toxicity criteria have been established for a subset of these pollutants pursuant to the California Health and Safety Code. In accordance with AB 2728, the state list includes the (federal) HAPs.

In 1987, the Legislature enacted the Air Toxics "Hot Spots" Information and Assessment Act of 1987 (AB 2588) to address public concern over the release of TACs into the atmosphere. AB 2588 requires facilities emitting toxic substances to provide local air pollution control districts with information that will allow an assessment of the air toxics problem, identification of air toxics emissions sources, location of resulting hotspots, notification of the public exposed to significant risk, and development of effective strategies to reduce potential risks to the public over 5 years. TAC emissions from individual facilities are quantified and prioritized. "High-priority" facilities are required to perform a health risk assessment (HRA), and if specific thresholds are exceeded, the facility operator is required to communicate the results to the public in the form of notices and public meetings.

Truck Idling Regulations

Section 2485 in Title 13 of the CCR states that the idling of all diesel-fueled commercial vehicles (weighing over 10,000 pounds) during construction shall be limited to 5 minutes at any location. In addition, Section 93115 in Title 17 of the CCR states that operations of any stationary, diesel-fueled, compression-ignition engines shall meet specified fuel and fuel additive requirements and emissions standards.

California Health and Safety Code Section 41700

Section 41700 of the Health and Safety Code states that a person shall not discharge from any source whatsoever quantities of air contaminants or other material that cause injury, detriment, nuisance, or annoyance to any considerable number of persons or to the public; or that endanger the comfort, repose, health, or safety of any of those persons or the public; or that cause, or have a natural tendency to cause, injury or damage to business or property. This section also applies to sources of objectionable odors.

Regulation for Mobile Cargo Handling Equipment at Ports and Intermodal Rail Yards

The Regulation for Mobile Cargo Handling Equipment at Ports and Intermodal Rail Yards, adopted by CARB in December 2005 and as amended in September 2011 (CCR Title 13, Section 2479), requires the use of best available control technology to reduce DPM and NO_x emissions from mobile cargo handling equipment at ports and intermodal railyards. Beginning in 2007, the regulation requires that newly purchased, leased, or rented cargo handling equipment for yard tractors be equipped with either a 2007 or newer on-road engine, a Tier 4 off-road engine, or the cleanest verified emissions control system that reduces DPM by 90% and NO_x by at least 70%. For non-yard tractor cargo handling equipment, the requirements include currently verified technologies that reduce DPM by 85%. The regulation also imposes retrofit, operational, emission standards, and compliance requirements 34 (CARB 2011).

2.2.3 Local Regulations

2.2.3.1 Southern California Association of Governments

SCAG is the regional planning agency for Los Angeles, Orange, Ventura, Riverside, San Bernardino, and Imperial Counties, and serves as a forum for regional issues relating to transportation, the economy, community development, and the environment. SCAG serves as the federally designated metropolitan planning organization for the Southern California region and is the largest metropolitan planning organization in the United States.

In 2024, SCAG's Regional Council adopted Connect SoCal (2024–2050 Regional Transportation Plan/Sustainable Communities Strategy [RTP/SCS]). Connect SoCal is a long-range visioning plan that balances future mobility and housing needs with economic, environmental, and public health goals. Connect SoCal charts a path toward a more mobile, sustainable, and prosperous region by making connections between transportation networks, between planning strategies and between the people whose collaboration can improve the quality of life for Southern Californians. Connect SoCal embodies a collective vision for the region's future and is developed with input from local governments, county transportation commissions, tribal governments, nonprofit organizations, businesses and local interested parties within Imperial, Los Angeles, Orange, Riverside, San Bernardino, and Ventura Counties (SCAG 2024).

2.2.3.2 Imperial County Air Pollution Control District

Although CARB is responsible for the regulation of mobile emissions sources within the state, local air quality management districts and air pollution control districts are responsible for enforcing standards and regulating stationary sources. ICAPCD is the regional agency responsible for the regulation and enforcement of federal, state, and local air pollution control regulations in the SSAB, where the project is located. ICAPCD operates monitoring stations in the SSAB, develops rules and regulations for stationary sources and equipment, prepares emissions inventory and air quality management planning documents, and conducts source testing and inspections. ICAPCD has implemented plans to attain state and federal standards of nonattainment pollutants, which are established in the CAAQS and NAAQS, in the SSAB. ICAPCD also provides rules and regulations to control or reduce criteria pollutant emissions from stationary sources or equipment. The County air quality, or clean air, plans for compliance with applicable federal and state air quality standards include:

- 2017 SIP for the 2008 8-Hour Ozone Standard, which includes a certified reasonably available control technology SIP analysis (2017 Ozone SIP)
- 2009 1997 8-Hour Ozone Modified AQMP
- 2018 Redesignation Request and Maintenance Plan for Particulate Matter less than 10 Microns in Diameter (2018 PM_{10} Plan)
- 2009 SIP for Particulate Matter Less Than 10 Microns in Aerodynamic Diameter
- 2018 County Annual Particulate Matter Less than 2.5 Microns in Diameter SIP
- 2009 Reasonably Available Control Technology SIP

Note that the Clean Air Act requires SIPs for nonattainment areas to require emission controls that are economically and technologically feasible. Emissions control technologies that meet these criteria are known as reasonably available control technology.

Regulations

All development projects within the ICAPCD are required to comply with existing ICAPCD rules as they apply to each specific project. Local provisions applicable to the Plan Area include the following:

ICAPCD Regulation I – General Provisions

Rule 106 – Abatement. The Board may, after notice and a hearing, issue, or provide for the issuance by the Hearing Board, of an order for abatement whenever the ICACPD finds that any person is in violation of the rules and regulations limiting the discharge of air contaminants into the atmosphere.

Rule 107 – Land Use. As part of his responsibility to protect the public health and property from the damaging effects of air pollution it shall be the duty of the Air Pollution Control Officer to review and advise the appropriate planning authorities within the ICACPD on all new construction or changes in land use which the Air Pollution Control Officer believes could become a source of air pollution problems.

ICAPCD Regulation II – Permits

Rule 207 – New and Modified Stationary Source Review. This Rule establishes preconstruction review requirements for new and modified Stationary Sources to ensure that the operation of such Sources do not interfere with the attainment or maintenance of Ambient Air Quality Standards (AAQS). This Rule shall provide for no net increase in emissions, pursuant to Health and Safety Code (H&SC) Section 40918, from new or modified Stationary Sources, which emit or have the Potential to Emit 137 pounds per day or more of any Nonattainment Pollutant or their Precursors

Rule 216 – Construction or Reconstruction of Major Stationary Sources that Emit Hazardous Air Pollutants. To require all owners and operators of stationary sources that emit hazardous air pollutants (HAPs) to install best available control technology for toxics (T-BACT) to any constructed or reconstructed major source. All T-BACT determinations shall be controlled to a level that the Air Pollution Control Officer (APCO) has determined to be, at a minimum, no less stringent than new source maximum achievable control technology (MACT) as required by the federal Clean Air Act (CAA), §112 (g)(2)(B) and implemented through 40 CFR §§63.40-63.44, of subpart B.

ICAPCD Regulation IV – Prohibitions

Rule 401 – Opacity of Emissions. Applies to any discharge of air pollutants and prohibits emissions in excess of specified opacity limits.

Rule 403 – General Limitations on the Discharge of Air Contaminants. Applies to the discharge of Air Contaminants, Combustion Contaminants, and Particulate Matter into the Atmosphere. Includes specific limitations and requirements for emissions from individual sources.

Rule 407 – Nuisances. No Person shall discharge from any Source whatsoever such quantities of Air Contaminants or other material which cause injury, detriment, nuisance or annoyance to any considerable number of persons or to the public or which endanger the comfort, repose, health or safety of any such persons or the public or which cause or have a natural tendency to cause injury or damage to business or property. This Rule shall not apply to odors emanating from agricultural operations necessary for the growing of crops or the raising of fowl or animals

Rule 414 – Storage of Reactive Organic Compound Liquids. Provisions of this Rule shall apply to any storage tank with a capacity equal to or greater than 1,500 gallons used to store Reactive Organic Compound (ROC) liquids with a true vapor pressure equal to or greater than 0.50 pounds per square inch absolute (psia).

Rule 424 – Architectural Coatings. Restricts the sale and application of architectural coatings, including limitations to VOC content in coatings.

ICAPCD Regulation VIII – Fugitive Dust Rules

Rules 800–806 – Limit the amount of fine PM entrained in the ambient air as a result of emissions generated from anthropogenic fugitive dust sources. Reasonably Available Control Measures are required during construction and operation activities to help reduce the amount of PM. This includes the application of dust suppressants or water once per hour, applying water to maintain a 12% soil moisture, implementation of wind barriers, installation of track-out control devices or wash down systems. Rule 805 also includes detailed standards for the use of unpaved roads, including limited use by the number of trucks and proximity to populated areas of 500 persons or more, and dust control methods including the application of gravel, watering, or closures. All construction sites, regardless of size, must comply with the requirements contained within Regulation VIII. Regulation VIII's main purpose is to reduce the amount of PM_{10} entrained into the atmosphere as a result of anthropogenic (human-made) fugitive dust sources. Therefore, under all preliminary modeling a presumption is made that all projects are in compliance with Regulation VIII.

ICAPCD Rule Standards to reduce Fugitive Dust

a. All disturbed areas, including Bulk Material storage which is not being actively utilized, shall be effectively stabilized and visible emissions shall be limited to no greater than 20% opacity for dust emissions by using water, chemical stabilizers, dust suppressants, tarps or other suitable material such as vegetative ground cover.
b. All on-site and off-site unpaved roads will be effectively stabilized and visible emissions shall be limited to no greater than 20% opacity for dust emissions by paving, chemical stabilizers, dust suppressants and/or watering.
c. All unpaved traffic areas one (1) acre or more with 75 or more average vehicle trips per day will be effectively stabilized and visible emission shall be limited to no greater than 20% opacity for dust emissions by paving, chemical stabilizers, dust suppressants and/or watering.

d. The transport of Bulk Materials shall be completely covered unless six inches of freeboard space from the top of the container is maintained with no spillage and loss of Bulk Material. In addition, the cargo compartment of all Haul Trucks is to be cleaned and/or washed at delivery site after removal of Bulk Material.
e. All Track-Out or Carry-Out will be cleaned at the end of each workday or immediately when mud or dirt extends a cumulative distance of 50 linear feet or more onto a paved road within an Urban area.
f. Movement of Bulk Material handling or transfer shall be stabilized prior to handling or at points of transfer with application of sufficient water, chemical stabilizers or by sheltering or enclosing the operation and transfer line.
g. The construction of any new Unpaved Road is prohibited within any area with a population of 500 or more unless the road meets the definition of a Temporary Unpaved Road. Any temporary unpaved road shall be effectively stabilized and visible emissions shall be limited to no greater than 20% opacity for dust emission by paving, chemical stabilizers, dust suppressants and/or watering.
h. Depending upon the project Regulation VIII, the ICAPCD may also provide for: Water exposed soil with adequate frequency for continued moist soil.
i. Replace ground cover in disturbed areas as quickly as possible
j. Automatic sprinkler system installed on all soil piles
k. Vehicle speed for all construction vehicles shall not exceed 15 mph on any unpaved surface at the construction site.
l. Develop a trip reduction plan to achieve a 1.5 AVR (average vehicle ridership) for construction employees
m. Implement a shuttle service to and from retail services and food establishments during lunch hours

Construction Equipment Exhaust

Although the preceding discussion of construction impacts and mitigation measures are primarily focused on PM_{10} emissions from fugitive dust sources, the ICAPCD states that lead agencies should also seek to reduce emissions from construction equipment exhaust (ICAPCD 2017b). Because of the availability of new control devices, required in the manufacturing of PM oxidation catalysts and NO_x absorbers, substantial reductions in PM and NO_x emissions from diesel engines is achievable. These new retrofit kits and in some cases new original equipment require the use of ultra-low sulfur diesel to be effective.

Standard Construction Combustion Equipment Conditions

a. Use of alternative fueled or catalyst equipped diesel construction equipment, including all off-road and portable diesel-powered equipment.
b. Minimize idling time either by shutting equipment off when not in use or reducing the time of idling to 5 minutes as a maximum.
c. Limit, to the extent feasible, the hours of operation of heavy-duty equipment and/or the amount of equipment in use
d. Replace fossil-fueled equipment with electrically driven equivalents (provided they are not run via a portable generator set)

To help provide a greater degree of reduction of PM emissions from construction combustion equipment the ICAPCD recommends the following enhanced measures.

Enhanced Construction Equipment Conditions

a. Curtail construction during periods of high ambient pollutant concentrations; this may include ceasing of construction activity during the peak hour of vehicular traffic on adjacent roadways
b. Implement activity management (e.g., rescheduling activities to reduce short-term impacts)

Projects are required to implement all standard conditions as well as enhanced conditions for construction and operation as listed in the ICAPCD CEQA Handbook (ICAPCD 2017b).

ICAPCD Community Emissions Reduction Plans

The ICAPCD also administers the implementation of the AB 617 program within its jurisdictional boundaries, which includes the development of a CERP for those communities designated as disadvantaged communities under AB 617 to identify cost-effective measures to achieve emission reduction targets in the community. Preparation of a CERP and community air monitoring plan are conducted by the jurisdiction and is not prepared for individual projects. The Plan Area encompasses a portion of the County North End Community comprising the cities of Brawley, Westmorland, and Calipatria newly designated as disadvantaged in 2023. The reduction measures outlined in the North Imperial Phase 1 Community CERP, as approved by CARB on June 13, 2025, encompasses a range of strategies to reduce community-level exposure burden, including regulatory, enforcement, outreach and education, voluntary incentive-based programs, as well as partnerships with other agencies to address issues outside of the ICAPCD's direct regulatory authority (ICAPCD 2025).

The Plan Area is also nearby to another disadvantaged community, the Calexico, El Centro, Heber community, which was designated in 2018. The ICAPCD has published a community air monitoring plan for the community in 2019 and has partnered with Comite Civico del Valle, Inc. to lead a community advocacy group to develop the community's CERP. The reduction measures outlined in the community's CERP, approved by the ICAPCD Board in October 2019, are designed to reduce community-level exposure burdens. These measures include regulatory actions, enforcement efforts, outreach and education initiatives, voluntary incentive-based programs, and partnerships other agencies to address air quality issues beyond ICAPCD's direct regulatory authority (ICAPCD 2019).

2.2.3.3 County of Imperial

Imperial County General Plan

Adopted in 1993, the Imperial County General Plan consists of 10 elements entitled Land Use, Housing, Circulation and Scenic Highways, Noise, Seismic and Public Safety, Agricultural, Conservation and Open Space, Renewable Energy and Transmission, Water, and Parks and Recreation. Goals and policies pertaining to improving air quality are addressed in multiple chapters of the General Plan 2040. The Conservation and Open Space Element and the Renewable Energy and Transmission Element are the most applicable chapters of the City's General Plan, including the following objectives and policies (Imperial County 2016, 2015):

Conservation and Open Space Element

Goal 7: The County shall actively seek to improve the quality of air in the region.

Objective 7.1: Ensure that all project and facilities comply with current Federal, State, and local requirements for attainment of air quality objectives.

Objective 7.2: Develop management strategies to mitigate fugitive dust. Cooperate with all Federal, State and local agencies in the effort to attain air quality objectives.

Objective 7.3: Work cooperatively with the EPA and CARB in evaluating air quality monitoring in Imperial County.

Objective 7.4: Enforce and monitor environmental mitigation measures relating to air quality.

Objective 7.5: Coordinate efforts with Imperial County Transportation Commission (ICTC) and other appropriate agencies to reduce fugitive dust from unpaved streets.

Policy 5a: Reduce PM10 and PM2.5 emissions from unpaved roads, agricultural fields, and exposed Salton Sea lakebed.

Policy 5b: Work cooperatively with ICTC and other appropriate agencies to reduce vehicle miles traveled countywide in order to improve air quality and reduce greenhouse gas emissions.

Policy 5c: Promote alternative transportation programs, policies, and development in order to reduce vehicle miles traveled and address air quality and greenhouse gas emissions.

Renewable Energy and Transmission Element

Goal 4: Support development of renewable energy resources that will contribute to the restoration efforts of the Salton Sea.

Objective 4.2: Encourage the development of renewable energy facilities that will contribute to the reduction or elimination of airborne pollutants created by exposure of the seabed of the Salton Sea as it recedes.

Imperial County Regional Climate Action Plan

Adopted in June 2021, the Imperial County Regional Climate Action Plan (ICRCAP) includes estimated emissions inventories for various jurisdictions in the Imperial Valley, forecasts regional and local GHG emissions into the future, and identifies GHG reduction strategies and measures that would be implemented at the regional level to address climate change and achieve regional and state targets. Various GHG reduction measures implemented by the ICRCAP would also reduce criteria air pollutants and improve air quality in the region. The relevant regional GHG reduction measures identified within the ICRCAP are discussed further in Section 3.3.3.2.

2.3 Significance Criteria and Methodology

2.3.1 Thresholds of Significance

The significance criteria used to evaluate the LVSP impacts to air quality are based on the recommendations provided in Appendix G of the CEQA Guidelines. For the purposes of this air quality analysis, a significant impact would occur if the LVSP would (14 CCR 15000 et seq.):

1. Conflict with or obstruct implementation of the applicable air quality plan
2. Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is nonattainment under an applicable federal or state ambient air quality standard
3. Expose sensitive receptors to substantial pollutant concentrations
4. Result in other emissions (such as those leading to odors) adversely affecting a substantial number of people

To address Threshold AQ-1, the potential for the project to conflict with or obstruct implementation of the applicable air quality plan, the project's potential to exceed the projected employment growth in the Imperial County 2018 PM_{10} Plan and the 2017 Ozone SIP regional growth projections were evaluated. CEQA Guidelines Appendix G indicates that, where available, the significance criteria established by the applicable air quality management district or air pollution control district may be relied upon to determine whether the project would have a significant impact on air quality. ICAPCD has adopted thresholds to address the significance of air quality impacts resulting from a project, which are applied to address Threshold AQ-2, the potential for the project to result in a project and cumulatively considerable net increase of any criteria pollutant for which the project region is nonattainment under an applicable federal or state ambient air quality standard.

Thresholds of significance (AQ-2) for project construction and operation are provided in Table 2-4. The project would result in a significant impact related to O_3, which is a nonattainment pollutant, if the project's construction or operational emissions exceeded ICAPCD's reactive organic gas or NO_x significance thresholds shown in Table 2-4. These emissions-based thresholds for O_3 precursors are intended to serve as a surrogate for an "O_3 significance threshold" (i.e., the potential for adverse O_3 impacts to occur) because O_3 itself is not emitted directly.

Table 2-4. Imperial County Air Pollution Control District Air Quality Significance Thresholds

Pollutant	Emissions (pounds per day)	
	Operational Threshold	Construction Threshold
ROGs	137	75
NO_x	137	100
CO	550	550
SO_x	150	N/A
PM_{10}	150	150
$PM_{2.5}$	550	N/A

Source: ICAPCD 2017b.

Notes: ROG = reactive organic gas; NO_x = oxides of nitrogen; CO = carbon monoxide; SO_x = sulfur oxides; N/A = not applicable; PM_{10} = coarse particulate matter; $PM_{2.5}$ = fine particulate matter.
The phasing out of leaded gasoline started in 1976. Because gasoline no longer contains lead, the project is not anticipated to result in impacts related to lead; therefore, it is not discussed in this analysis or included in Table 2-4.

To address Threshold AQ-3, the potential for the project to expose sensitive receptors to substantial pollutant concentrations, potential impacts related to TAC emissions and associated health risk, CO hotspots, and valley fever are evaluated.

ICAPCD does not have any quantified maximum incremental health risk thresholds. In accordance with ICAPCD guidelines, a construction and operational HRA was prepared, as discussed below. In light of the lack of established health risk thresholds that would apply to the project, CEQA allows lead agencies to identify thresholds of significance applicable to a project that are supported by substantial evidence. Therefore, to establish additional context in which to consider the order of magnitude of the project's TAC emissions, this analysis accounts for the following considerations by other government agencies and associations about what levels of TAC emissions constitute a significant health risk:

- The San Diego Air Pollution Control District established the following health risk thresholds: incremental cancer risk of 10 in 1 million, chronic hazard index of 1, and acute hazard index of 1.
- SCAQMD established the following health risk thresholds: incremental cancer risk of 10 in 1 million, chronic hazard index of 1, and acute hazard index of 1.
- The Mojave Desert Air Quality Management District established the following health risk thresholds: incremental cancer risk of 10 in 1 million, chronic hazard index of 1, and acute hazard index of 1.

Based on the above consistently applied thresholds across nearby air districts, the following health risk thresholds are applied herein to evaluate the potential for a significant impact: incremental cancer risk of 10 in 1 million, chronic hazard index of 1, and acute hazard index of 1.

To address Threshold AQ-4, the potential for the project to result in other emissions (such as those leading to odors) adversely affecting a substantial number of people, if a determination is made that a development project has the potential to cause a nuisance problem that impacts a considerable number of people, the project may be considered as having a significant effect (ICAPCD 2017b). The project would have a significant impact if it creates a nuisance pursuant to ICAPCD Rule 407, Nuisances, as defined in Section 2.2.3.2. Land uses and industrial operations associated with odor complaints include agricultural uses, wastewater treatment plants, food processing plants, chemical plants, composting, refineries, landfills, dairies, and fiberglass molding facilities (SCAQMD 1993).

2.3.2 Approach and Methodology

As described above, the LVSP is a policy document that does not include or propose any site-specific development. However, the LVSP would facilitate additional future development. Therefore, this document does not assess the site-specific construction and operational details of each future development within the LVSP area. Rather, it assesses the impacts associated with overall buildout. Analysis at a parcel- or site-specific level was not conducted because unless otherwise noted within this assessment, the actual locations of project development (and its chronologic sequence or concurrence) that may be implemented in the future are speculative.

Lithium Valley Specific Plan Measures and Regulations

Future development within LVSP would be subject to the following policies and regulations related to air quality (Imperial County 2025):

Program HP-7 Equipment Exhaust Minimization. Within Goal 5: Community Health and Prosperity (HP) of the Lithium Valley Specific Plan, Policy HP-7 requires all diesel-fueled off-road equipment shall meet EPA-rated Tier 4 Final engines consistent with Cal. Code Regs., tit. 13 § 2449 et seq. Electric or net-zero emissions equipment is preferred when commercially available and would also meet this requirement.

Program HP-7 is quantified in the construction and operational analyses.

Policy HP-18 Dust Suppression. Within Goal 5: Community Health and Prosperity (HP) of the Lithium Valley Specific Plan, Policy HP-18 requires future development projects to demonstrate compliance with ICAPCD Rules 800-806, all construction activities within the Specific Plan Area must implement the following dust control measures at a minimum:

- Water the exposed area three times per 8-hour workday at a minimum
- Water demolished area two times per 8-hour workday at a minimum
- For on-road fugitive dust, water unpaved roads two times daily at a minimum
- Limit vehicle speeds on unpaved roads to 15 miles per hour
- Sweep paved roads one per month at a minimum
- Pave unpaved roads as soon as feasible during the construction process

Policy HP-18 is quantified in the construction analysis within the California Emissions Estimator Model (CalEEMod) where “water three times per day,” “water demolished area,” “water unpaved construction roads,” and “limit vehicle speeds on unpaved roads” were selected.

Policy HP-19 Paved Roads. The County will ensure that all future development projects within the Plan Area are accessible by a paved road prior to providing a certificate of occupancy.

Policy HP-19 is not quantified in the analysis.

ICAPCD Dust Control Plan Requirements. Prior to the issuance of grading permits for an individual project, the individual project applicant or its designee shall develop and implement a dust control plan to reduce future project-generated construction dust and comply with applicable Air District rules and regulations. The plan shall include the following (ICAPCD 2005):

- The name(s), address(es), and phone number(s) of person(s) responsible for the preparation, submission, and implementation of the dust control plan and responsible for the project site;
- A sign posted at the project site that is visible to the public that includes a contact phone number for the public to report dust complaints;
- A plot plan which shows the type and location of each project;

- The total area of land surface to be disturbed, estimated daily throughput volume of earthmoving in cubic yards, and total area in acres of the entire project site;
- The expected start and completion dates of dust generating and soil disturbance activities to be performed on the site;
- The actual and potential sources of Fugitive Dust emissions on the site and the location of Bulk Material handling and storage areas, Paved and Unpaved Roads, entrances and exits where Track Out/Carry Out may occur, and Unpaved Traffic Areas;
- Dust Suppressants to be applied, including: product specifications; manufacturer's usage instructions (method, frequency, and intensity of application); type, number, and capacity of application equipment; and information on environmental impacts and approvals or certifications related to appropriate and safe use for ground application;
- Specific surface treatment(s) and/or control measures utilized to control Track Out/Carry Out, and sedimentation where unpaved and/or access points join paved public access roads;
- The dust control plan should describe all Fugitive Dust control measures to be implemented before, during, and after any dust generating activity

In compliance with ICAPCD Regulation VIII Rule 801, all construction within the Specific Plan Area would incorporate all the mandatory fugitive dust control elements as stated below:

A. Pre-Activity:
   a. Pre-water site sufficient to limit VDE [visible dust emissions] to 20% opacity, and
   b. Phase work to minimize the amount of disturbed surface area at any one time.

B. During Active Operations:
   a. Apply water or Chemical Stabilization as directed by product manufacturer to limit VDE to 20% opacity, or
   b. Construct and maintain wind barriers sufficient to limit VDE to 20% opacity. If utilizing wind barriers, control measure B.ii. above shall be implemented.
   c. Apply water or Chemical Stabilization as directed by product manufacturer to unpaved haul/access roads and Unpaved Traffic Areas sufficient to limit VDE to 20% opacity and meet the conditions of a Stabilized Unpaved Road.

C. Temporary Stabilization During Periods of Inactivity:
   a. Restrict vehicular access to the area by fencing or signage; and
   b. Apply water or Chemical Stabilization, as directed by product manufacturer, sufficient to comply with the conditions of a Stabilized Surface. If an area having 0.5 acres or more of disturbed surface area remains unused for seven or more days, the area must comply with the conditions for a Stabilized Surface area.

D. Track Out/Carry Out of Bulk Materials at the site shall be mitigated in compliance with Rule 803.

E. Unpaved Roads and Unpaved Traffic Areas at the site shall comply with Rule 805.

F. Bulk Material handling operations at the site shall comply with Rule 802.

G. Material transport of Bulk Material to, from, or around the site shall comply with Rule 802.

H. Haul trucks transporting Bulk Material to, from, or around the site shall comply with Rule 802.

ICAPCD Dust Control Plan requirements are not quantified in the analysis.

The following LVSP policies, programs, conditions, and design standards would further reduce air quality impacts and would have co-benefits related to GHG emissions, energy, and transportation; however, these measures were not quantified in the analysis or the estimation of criteria air pollutant emissions resulting from the development of the project.

Goal: Land Use (LU)

Policy LU-2: Ensure that developments of renewable energy facilities and transmission lines comply with the Imperial County Air Pollution Control District's regulations and mitigation measures. This includes dust suppression methods.

Policy LU-3: Promote land development practices that reduce energy and water consumption, air and water pollution, and greenhouse gas emissions.

Policy LU-4: Transit Supportive Development: Cluster employment around shared parking and major transit corridors and transfer nodes.

Policy LU-5: Reduce Airborne Pollutants through Land Use: Encourage the development of renewable energy facilities that will contribute to the reduction or elimination of airborne pollutants created by exposure of the seabed of the Salton Sea as it recedes.

Policy LU-10: Renewable Energy Leader: Install solar photovoltaic (PV) systems with a generation capacity at least 25% greater than the minimum requirements established by the 2022 California Building Standards Code (Title 24, Part 6). This would no longer apply if the most current California Building Code were to exceed 25% the 2022 requirement. Where feasible, implement alternative renewable energy sources (e.g., geothermal) to supplement on-site solar energy production.

Goal: Circulation & Transportation (CT)

Policy CT-1: Land Use Clustering: Cluster employment around shared parking and major transit corridors and transfer nodes.

Policy CT-4: Roadway Network: Develop a roadway network based on functional and urban design considerations, emphasizing connectivity and linkages, increasing transit movement and reducing total person delay, and compatibility with adjacent land uses.

Policy CT-12: Transportation Choices: Increase transportation choices within the Specific Plan area by providing viable alternatives to the exclusive reliance on vehicular travel by Lithium Valley employees and visitors.

Policy CT-13: Diverse Modes of Transportation: The County will support the diversification of travel modes used in Lithium Valley to increase employee trips made by bicycle, or public transit, including new mobility types like electric shuttles, electric vanpool/carpool, electric carsharing service, docked bikeshare, and e-scooter share.

Policy CT-14: Sustainable Freight: Promote sustainable freight transport modes and enhance regional economic competitiveness through efficient crossborder trade operations, realizing benefits such as reduced emissions, improved air quality, and long-term cost savings in logistics and transportation.

Policy CT-15: Zero Emission Vehicles: In support of California's Climate Action Plan for Transportation Infrastructure, (CAPTI) 2.0, the County will support the innovation in and development of the zero-emission vehicle (ZEV) infrastructure.

Policy CT-16: VMT Mitigation Bank: In support of California's Climate Action Plan for Transportation Infrastructure, (CAPTI) 2.0, the County will support Caltrans' statewide VMT mitigation bank or exchange program at the local and regional level.

Policy CT-19: Increased Bus Frequencies: The project tenants or individual employers shall coordinate with IVT to update bus service routes and service times to serve the project. The frequency of Imperial Valley Transit Route 2 will be significantly enhanced. On weekdays, service intervals will be reduced from the current 60-180 minutes to 15-30 minutes, while service internals on weekends will improve to 30-60 minutes. This increase is designed to provide more reliable and convenient transit options for residents and workers.

Policy CT-20: Dedicated Bus Lane on SR-111: The County, IVT, and project tenants shall coordinate with Caltrans for construction of a new outside lane, exclusive to buses, defined as a dedicated bus lane. This lane would significantly improve the reliability and timeliness of transit services, making public transportation a more attractive option for residents of the County.

Policy CT-21: Transit Hubs: As illustrated in Figure 5-10, Transit Network Map, strategically located transit hubs will be established to facilitate seamless connectivity. These hubs will serve as essential nodes within the transit system. Transit or Mobility hub is a central place where multiple modes of transportation converge, designed to facilitate seamless transfers, improve accessibility, and reduce travel time for commuters.

- The locations of the hubs are intended to connect the communities of Niland and Calipatria with the employment hub in the heart of the Plan Area. Implementation of Transit Hub would require coordination with IVT, Imperial County and communities of Niland and Calipatria.
- Each transit hub will include designated spaces for park and ride lots, shared vehicles, and shuttles to employment centers, ensuring efficient transfers and accessibility for commuters. Transit Hubs should be supplemented with additional strategies or programs that provide increased public transit, bicycle, and pedestrian access and improvements. The Transit Hub is anticipated to strengthen the effectiveness of other proposed TDM strategies.

Policy CT-22: Express Bus Routes: The County, IVT, and project tenants shall identify additional express bus routes that may be implemented based on the region's needs and demand and connect to the Plan Area. The express bus route shall consider stops at various locations within the northern communities inclusive of transit hubs and employment centers. This service will link workers to their jobs, promote rideshare opportunities, provide further travel opportunities to the general public and reduce greenhouse gas emissions. Express routes will also connect Calipatria to SDSU

Brawley Campus and Imperial Valley College, facilitating access to educational institutions and expanding opportunities for residents.

Policy CT-23: Employee Shuttle: An employee shuttle shall be implemented once there are three (3) employers with over 200 on-site employees, for a total of over 600 employees in the Plan Area. The employee shuttle would connect the transit hubs at Niland and Calipatria to the employment centers of over 200 on-site employees. This service would link workers to their jobs, promote rideshare opportunities and reduce greenhouse gas emissions. The employee shuttle or express bus route may be funded and operated by one or more of the following: the newly established Lithium Valley Infrastructure Special District, the participating private employers, or ICTC. In collaboration with ICTC and SCAG, Imperial County would also enhance transit safety and convenience by upgrading transit stops with shelters and real-time trip information systems. Improvements would be triggered based on operational needs and employment metrics, with a shuttle system introduced to connect employees to transit hubs and commercial destinations.

Policy CT-24: Construction Traffic Management Plan: The Project Applicant/Developers shall prepare a Construction Traffic Management Plan (CTMP), which shall be implemented by the construction contractor to address short-term traffic circulation, safety and access effects during project construction. The CTMP shall be reviewed and approved by the County prior to the issuance of the first building permit. The TMP and its requirements shall also be provided to all construction contractors as one component of building plan/contract document packages. The CTMP shall include, but not be limited to, the elements described below:

- Where applicable, maintain existing access for land uses in proximity of the project throughout construction.
- Where applicable, coordinate with adjacent or affected businesses and/or properties and emergency service providers to ensure adequate access exists to the project and neighboring sites.
- Where applicable, provide notification to transit providers, emergency service personnel, and local businesses and residents in advance of construction activities.
- Use measures to encourage and facilitate carpooling among construction workers to reduce use of single occupancy vehicles for commuting to the project site.
- Identify designated transport routes for heavy trucks to be used throughout project construction.
- Identification and description of Material Storage Locations (if any).
- Location and description of Construction Trailer (if any).
- Identification and Description of Parking - Estimate the number of workers and identify parking areas for their vehicles.
- Identification and Description of Maintenance Measures - Identify and describe measures taken to ensure that the work site and public right-of-way would be maintained (including dust control).
- Schedule deliveries and pick-ups of construction materials to non-peak travel periods along major travel corridors such as SR-111.
- Construction traffic shall be routed to avoid travel through, or proximate to, sensitive land uses.

- All temporary signage, temporary traffic control measures such as lane closures; the use of warning signs, cones, crossing structures, lights, and barricades will conform to the CA MUTCD [Manual on Uniform Traffic Control Devices].
- Flaggers that serve to alert motorists and pedestrians to slow moving trucks and to guide trucks to maneuver turn movement and prioritize movement of traffic at intersections to access highway and reduce queuing at major intersections and to facilitate truck turn maneuvers in and out of the project driveways.
- Coordination with Caltrans and Imperial County in order to secure the necessary encroachment and trip permits necessary for any oversized haul trucks.
- All construction contractors shall be provided with written information on the CTMP along with clear consequences to violators for failure to follow the plan.

Goal: Infrastructure (I)

Policy I-3: Water Recycling: Require all mineral recovery operations to recycle 20% of their water within the mineral recovery process itself, with the exception of reinjected brine water. Every five years the percentage shall go up 10% until it reaches an 80% water recycling requirement in 2055.

Policy I-17: Hazardous Material Handling and Pollution Prevention: Enforce strict procedures for handling hazardous materials to prevent pollution of air, water, and soil during waste management and disposal activities.

Program I-15: As roadways are improved, retrofit streetlights with LEDs.

Program I-17: Where feasible, the County shall supply municipal facilities with on-site renewable electricity.

Program I-26: Implement regulations to prevent air, water, and soil pollution during waste handling and disposal.

Goal: Community Health and Prosperity (HP)

Policy HP-4: Electric Vehicle Charging: Facilitate the deployment of EV charging infrastructure through the collaboration with local organizations to identify the best locations, funding mechanisms, and maintenance plans for EV charging stations.

Policy HP-8: Reduce Dust: Reduce fugitive windblown dust from unpaved roads and surfaces, especially related to truck traffic and agricultural operations.

Policy HP-9: Renewable by Phase 2: Mandate the use of 95%(on average) renewable energy in the mineral recovery process by 2040.

Policy HP-13: Zero-Emission Transportation: Continue to work with the Imperial County Transit Commission to offer zero-emission transportation methods throughout the North End of Imperial County.

Policy HP-20: Emergency Generators: The County will encourage through streamlined permitting/processing the use of alternative fuels and low emission engines designs for all emergency generators with the plan area to the extent feasible.

Program HP-5: Facilitate the deployment of air quality monitors within the Specific Plan Area through collaboration with local organizations to identify the best locations, funding mechanisms, and maintenance plans for air quality monitoring stations. This effort may also recommend and implement colored flags to signify Air Quality Index (AQI) levels.

Program HP-6: In addition to what is required in Section 4.2.1B. Indoor and Outdoor Break Areas, develop an incentive program for employers to provide indoor air purifiers to improve indoor air quality.

3.5 Standard Use Conditions

3.5.2 Anaerobic Digesting Facility

- Anaerobic Digestor facilities shall implement control technologies to minimize greenhouse gas (GHG) emissions, odor, and particulate matter from exiting the facility. Routine air quality testing must be conducted to ensure compliance with all Federal, State, and local emission standards.
- Advanced odor management systems (e.g. biofilters or carbon scrubbers) shall be required to control and minimize offsite odor impacts.

3.5.4 Data Centers

- For by-right data center projects, data centers must be powered on average by 30% or more from renewable energy sources, and carbon neutrality by 2045.
- Data centers must maintain an energy efficiency rating of 1.5 or lower through techniques such as advanced cooling systems, server virtualization, and energy-efficient hardware.

3.5.5 Hydrogen Fueling Stations

- Demonstrate that dispensed hydrogen is generated by at least 30% eligible renewable resources including: biomass, digester gas, municipal solid waste gas, fuel cells using renewable fuels, geothermal, photovoltaic, and wind. By 2045, the hydrogen fuel station shall demonstrate dispensed hydrogen is generated by 100% eligible renewable resources.

4.2 Design Standards

4.2.1 Site Design Standard

- Building Orientation
  - Maximize passive solar heating in the winter and minimize heat gain in the summer by the orienting longest facades of buildings east-west to mitigate heat gain and break up long warehouse buildings along main north-south vehicular corridors.
  - Loading bays shall be oriented internally between warehouse buildings to provide passive shading for loading facilities and trucks

- Indoor and Outdoor Break Areas
  - For industrial and office-type buildings, designate indoor 'clean zones' with HEPA air filtration for high-occupancy areas, such as control rooms and employee lounges. Include airlocks at entry points to reduce particulate tracking into the building, where feasible.
- Shade
  - All developments shall provide shade for at least 40%of all outside common or break areas within the development.
  - All development shall provide shade for at least 35%of all pedestrian routes within the development, including sidewalks, paseos, and pedestrian pathways.
- Parking Area Design
  - Photovoltaic arrays are encouraged to be roof-mounted on buildings and carports. Battery storage areas shall be screened with landscape screening or by an enclosure built with solid walls.
  - Incorporate a minimum of one (1) of the following design features in surface parking areas within the development:
    - Carports/ shade structures for 50%of all parking areas, common amenity areas, and pedestrian walkways. This requirement does not apply to tractor/trailer/semi-trucks and trailers and other vehicles used for industrial activities.
    - Increased paving with a high albedo, such as permeable pavers, porous asphalt, reinforced grass pavement (turf-crete), stone pavers, light-colored concrete, pervious concrete, high albedo asphalt, water-permeable asphalt, recycled class and rubber, photocatalytic concrete, reflective coatings.

4.2.3 Building Design

F. Energy Efficiency

- Install air-cooling systems or closed-loop water cooling systems in lieu of conventional air conditioning systems.
- Achieve 20%or better insulation performance than the current California Building Code through high R-value insulation, low U-value windows, and/or advanced window glazing systems. This would no longer apply if the most current California Building Code were to reach the maximum performance level.
- Buildings with loading docks shall provide electric outlets to power truck refrigeration units rather than allow trucks to idle while unloading. Electric outlets within truck loading docks shall also be built to installed to be compatible with EV truck charging.

CalEEMod 2022 Version 2022.1.1.29 was used to estimate emissions from construction and operation of the project (CAPCOA 2022). CalEEMod is a statewide computer model developed in cooperation with air districts throughout the state to quantify criteria air pollutant and GHG emissions associated with construction activities and operation of a variety of land use projects, such as residential, commercial, and industrial facilities. CalEEMod input parameters, including the land use type used to represent the project and its size, construction schedule, and

anticipated use of construction equipment, were based on information provided by the County or on default model assumptions if project specifics were unavailable.[4]

Table 2-5 presents the land use designations and land use types for the Project.

Table 2-5. Land Use Designation and Land Use Development Summary for the Project

Land Use Designation	Land Use Type
Solar	Commercial-Scale Solar
	Substations or transmission facilities
	Battery Energy Storage System
	Agrivoltaics
Floodway (River Corridor)	Passive Recreation
	Native Riparian Restoration
	Floatovoltaics
Community Opportunity Areas	Commercial
	Temporary Workforce Housing
	Emergency Services
	Public Transit Hub
	Housing
	Parks
	Workforce Training and Employment Services
Conservation	Habitat Restoration
	Passive Recreation
	Cultural Resource Preservation
Playas Renewables	Geothermal Energy and Ops
	Mineral Recovery, Processing, and Production
	Battery Manufacturing
	Research and Development
	Substations and transmission facilities

	Business Industrial Parks
	Geothermal Energy and Operations
	Commercial-Scale Solar
	Temporary Construction Housing

2.3.2.1 Construction Emissions

Construction Scenario Assumptions

Based on information provided by the County, it is assumed that construction of the LVSP development would last 30 years, with the total construction period split into three consecutive 10-year phases. Construction was modeled to commence in January 2025[5] and conclude in December 2054. A summary of the LVSP development construction schedule is as follows:

- Phase 1: January 2025–December 2034
- Phase 2: January 2035–December 2044
- Phase 3: January 2045–December 2054

Although construction specifics for buildout of the LVSP development are unknown at this time, the analysis contained herein is based on each of the three 10-year buildout phases, with Year 1 of Phase 1 (2025) being the

[5] Although January 2025 has already passed since the inception of the Lithium Valley Specific Plan and its details, Phase 1 construction was initially modeled to begin in January 2025. This timeline reflects a conservative approach, considering that construction equipment would become more efficient over time due to the continual adoption of increasingly stringent Tier 4 regulations, fuel economy standards, and increased vehicular electrification.

estimated worst-case construction year because equipment and vehicle emission factors for later years would be slightly more efficient due to more stringent standards for off-road equipment and heavy-duty trucks, as well as fleet turnover replacing older equipment and vehicles in later years. To estimate construction for each buildout phase, default construction assumptions from CalEEMod were adjusted to fit a compressed 10-year timeline. To reflect the shortened construction schedule, equipment usage was scaled by a factor of 6 for Phase 1 and by a factor of 3 for Phases 2 and 3. This scaling accounts for the increased intensity of construction activity required to complete each phase within 10 years (i.e., compressing a 30-year schedule to 10 years [1/3 of the time] for Phase 1 and 15 years to 10 years [2/3 of the time] for Phases 2 and 3). Worker and vendor trips were multiplied by the same scaling factors to reflect the compressed construction period. CalEEMod default trip length values were used for the distances for all construction-related trips.

The following six default CalEEMod construction phases were included to present the potential range of emissions and capture a potential maximum daily and annual scenario: demolition, site preparation, grading, building construction, paving, and architectural coating. However, not all future development outlined in the LVSP would require each of these construction phases. Although only one phase of each type of construction activity is included in the model run, it is anticipated that this model scenario would include construction activity at more than one site within the Plan Area. For example, due to the undeveloped nature of most parcels in the Plan Area, many future projects may not require any demolition but would require site preparation and/or grading to prepare the site for development. For emissions modeling purposes, it was assumed that all construction phases (i.e., demolition, grading, paving, etc.) could occur simultaneously and would span the entire 10-year period.

The LVSP would implement Program HP-7, which requires all diesel-fueled off-road equipment to meet EPA-rated Tier 4 Final engines consistent with 13 CCR Section 2449 et seq. Electric or net-zero-emissions equipment is preferred when commercially available and would also meet this requirement. As such, Tier 4 Final construction equipment was assumed in the modeling.

- Any future construction resulting from implementation of the project would be required to implement Policy HP-18, Dust Suppression, and to comply with ICAPCD Regulation VIII to control dust emissions during any dust-generating activities. ICAPCD Regulation VIII requires implementation of various best available fugitive dust control measures for different sources for all construction activity within ICAPCD jurisdictional boundaries. Dust control measures include, but are not limited to, maintaining stability of soil through pre-watering of the site prior to clearing, grubbing, cut and fill, and earth-moving activities; stabilizing soil during and immediately after clearing, grubbing, cut and fill, and other earth-moving activities; stabilizing backfill during handling and at completion of activity; and pre-watering material prior to truck loading and ensuring that freeboard exceeds 6 inches. Although ICAPCD Regulation VIII requires fugitive dust control beyond watering control measures, compliance with ICAPCD Rule 403 is represented in CalEEMod by assuming three times daily watering of active sites (74% reduction in PM_{10} and $PM_{2.5}$ [CAPCOA 2022]).
- Furthermore, any future construction resulting from implementation of the project would be required to comply with ICAPCD Rule 424 (Architectural Coatings), which requires that the construction contractor shall procure architectural coatings that comply with the ICAPCD grams per liter VOC limits as identified by application type (paint and other finishes) to reduce associated VOC emissions.

Phase 1 (2025–2034)

Phase 1 would include development of a total of approximately 24,728,110 square feet of building space across 25,520 acres of mixed land uses. Phase 1 would also include development of new paved roads, surface parking spaces, parking structures, landscaping, and paved surfaces for circulation.

Land use development in Phase 1 is broken down into eight land use designations, as shown in Table 2-6. Due to modeling limitations, the land use figures seen in Table 2-6 were split into two model runs (Phase 1a: January 2025–December 2029, Phase 1b: January 2030–December 2034) that together represent construction during Phase 1. To inform the model, each land use designation was assigned a surrogate land use within CalEEMod based on the most representative anticipated project activity within the land use designation. The acreage and square footage of building space for each land use designation are shown in Table 2-6.

Table 2-6. Phase 1 Construction Land Use Information

Plan Land Use Designation	CalEEMod Land Use Subtype	Land Use Size (acres)[a]	Building Space (square feet)
Solar	Industrial – General Heavy Industry	1,768	50,000
Community Opportunity Areas	Commercial – General Office Building	815	532,793
Playas Renewables	Industrial – General Heavy Industry	2,313	1,511,362
Green Industrial	Industrial – General Heavy Industry	7,290	15,082,763
Manufacturing	Industrial – Manufacturing	1,834	2,996,137
Logistics	Industrial – Manufacturing	2,319	4,545,055
Floodway/River Corridor[b]	Recreational – City Park	1,042	—
Conservation[b]	Recreational – City Park	8,140	—
	Total	**25,520**	**24,728,110**

Notes: See Appendix A, Construction CalEEMod Files, for detailed land use figures. CalEEMod = California Emissions Estimator Model

a Land uses were input into CalEEMod based on building square footage.

b Due to modeling limitations, a separate CalEEMod model run was performed for the Floodway/River Corridor and Conservation land uses in Phase 1.

These land uses would not include buildings or require demolition. Construction phasing for the Floodway/River Corridor and Conservation land uses was modeled to be consistent with the start and end dates for Phase 1 construction (January 2025–December 2034).

The construction equipment mix and vehicle trips used for estimating construction emissions are shown in Table 2-7. For emissions modeling purposes, it was assumed that all construction phases would occur simultaneously and would span the entire 10-year period. For the analysis, it was assumed that heavy construction equipment would be operating at the site 5 days per week (22 days per month) during proposed project construction.

Table 2-7. Phase 1 Construction Scenario Assumptions

Construction Phase	One-Way Vehicle Trips			Equipment		
	Average Daily Worker Trips	Average Daily Vendor Truck Trips	Total Haul Truck Trips	Equipment Type	Quantity	Usage Hours
Demolition	90	24	2	Concrete/Industrial Saws	6	8
				Excavators	18	8
				Rubber-Tired Dozers	12	8
Site Preparation	108	24	0	Rubber-Tired Dozers	18	8
				Tractors/Loaders/Backhoes	24	8
Grading	120	24	48	Excavators	12	8
				Graders	6	8
				Rubber-Tired Dozers	6	8
				Tractors/Loaders/Backhoes	12	8
				Scrapers	12	8
Building Construction	6,168	2,418	0	Cranes	6	8
				Forklifts	18	6
				Generator Sets	6	8
				Tractors/Loaders/Backhoes	18	6
				Welders	6	8
Paving	90	24	0	Pavers	12	8
				Paving Equipment	12	8
				Rollers	12	8
Architectural Coating	1,236	24	0	Air Compressors	6	8
Site Preparation – Floodway/River Corridor and Conservation[a]	144	32	0	Rubber-Tired Dozers	24	8
				Tractors/Loaders/Backhoes	32	8
Grading – Floodway/River Corridor and Conservation[a]	160	32	0	Excavators	16	8
				Graders	8	8
				Rubber-Tired Dozers	8	8
				Scrapers	16	8
				Tractors/Loaders/Backhoes	16	8

Notes: See Appendix A for detailed information.
Table 2-7 represents total construction information for Phase 1, aggregating the equipment list and trip counts from both model runs for Phase 1 and the Floodway/River Corridor Construction phase.
The equipment listed in Table 2-7 reflects Tier 4 Final engine tier and dust control requirements per Program HP-7 and Policy HP-18.

[a] Due to modeling limitations, a separate CalEEMod model run was performed for the Floodway/River Corridor and Conservation land uses in Phase 1.

Although the majority of the site is undeveloped, with few existing structures that would be demolished, for emissions modeling purposes, demolition activity during Phase 1 was conservatively estimated to include the demolition and export of 10,000 square feet of building debris per year. This demolition would require trucks hauling debris from the project site; hauling for demolition export is reflected in the truck trip figures included in Table 2-7.

Phase 1 would also require earthwork and material movement (i.e., import and export) of existing land. In the absence of project specifics, a conservative estimate of 500,000 cubic yards was used for both import and export, based on site acreages. This material movement would require hauling to and from the project site; hauling for grading export is reflected in the truck trip figures included in Table 2-7.

Phase 1 would also require the paving of project site areas for parking, circulation, etc. In the absence of project specifics, paved area was calculated by subtracting the building area and landscape area from the total acreage. It was conservatively assumed that 100% of the paved area would be composed of asphalt.

Phase 2 (2035–2044)

Phase 2 would include development of a total of approximately 13,534,427 square feet of building space across 13,663 acres of mixed land uses. Phase 2 would also include development of new paved roads, surface parking spaces, parking structures, landscaping, and paved surfaces for circulation.

Land use development in Phase 2 is broken down into five land use designations, as shown in Table 2-8. Due to modeling limitations, the land use figures seen in Table 2-8 were split into two model runs (Phase 2a: January 2035–December 2039, Phase 2b: January 2040–December 2044), together representing construction during Phase 2. To inform the model, each land use designation was assigned a surrogate land use within CalEEMod based on the most representative anticipated project activity within the land use designation. The acreage and square footage of building space for each land use designation are shown in Table 2-8.

Table 2-8. Phase 2 Construction Land Use Information

Plan Land Use Designation	CalEEMod Land Use Subtype	Land Use Size (acres)[a]	Building Space (square feet)
Community Opportunity Areas	Commercial – General Office Building	828	1,082,063
Playas Renewables	Industrial – General Heavy Industry	4,344	2,838,429
Green Industrial	Industrial – General Heavy Industry	2,712	2,362,365
Manufacturing	Industrial – Manufacturing	1,375	1,496,911
Logistics	Industrial – Manufacturing	4,404	5,754,659
	Total	**13,663**	**13,534,427**

Notes: See Appendix A, Construction CalEEMod Files, for detailed land use figures. CalEEMod = California Emissions Estimator Model.
[a] Land uses were input into CalEEMod based on building square footage.

The construction equipment mix and vehicle trips used for estimating construction emissions are shown in Table 2-9. For emissions modeling purposes, it was assumed that all construction phases would occur simultaneously and

would span the entire 10-year period. For the analysis, it was assumed that heavy construction equipment would be operating at the site 5 days per week (22 days per month) during proposed project construction.

Table 2-9. Phase 2 Construction Information

Construction Phase	One-Way Vehicle Trips			Equipment		
	Average Daily Worker Trips	Average Daily Vendor Truck Trips	Total Haul Truck Trips	Equipment Type	Quantity	Usage Hours

				Rollers	6	8
Architectural Coating	558	12	0	Air Compressors	3	8

Notes: See Appendix A, Construction CalEEMod Files, for detailed information.
Table 2-9 represents total construction information for Phase 2, aggregating the equipment list and trip counts from both model runs for Phase 2.
The equipment listed in Table 2-9 reflects Tier 4 Final engine tier and dust control requirements per Program HP-7 and Policy HP-18.

As in Phase 1, demolition activity during Phase 2 was conservatively estimated to include the demolition and export of 10,000 square feet of building debris per year. This demolition would require trucks hauling debris from the project site; hauling for demolition export is reflected in the truck trip figures included in Table 2-9.

Phase 2 would also require earthwork and material movement (i.e., import and export) of existing land. In the absence of project specifics, a conservative estimate of 250,000 cubic yards was used for both import and export, based on site acreages. This material movement would require hauling to and from the project site; hauling for grading export is reflected in the truck trip figures included in Table 2-9.

Phase 2 would also require the paving of project site areas for parking, circulation, etc. In the absence of project specifics, paved area was calculated by subtracting the building area and landscape area from the total acreage. It was conservatively assumed that 100% of the paved area would be composed of asphalt.

Phase 3 (2045–2054)

Phase 3 would include development of a total of approximately 8,759,333 square feet of building space across 12,439 acres of mixed land uses. Phase 3 would also include development of new paved roads, surface parking spaces, parking structures, landscaping, and paved surfaces for circulation.

Land use development in Phase 3 was broken down into four land use designations, as shown in Table 2-10. Due to modeling limitations, the land use figures seen in Table 2-10 were split into two model runs (Phase 3a: January 2045–December 2049, Phase 3b: January 2050–December 2054[6]), together representing construction during Phase 3. To inform the model, each land use designation was assigned a surrogate land use within CalEEMod based on the most representative anticipated project activity within the land use designation. To capture likely paved areas on site for parking and vehicle circulation, an amount of parking lot square footage was included in each land use, amounting to two times the amount of building space per land use. Furthermore, to capture likely landscaping area that would be included at each land use site, an amount of landscaping square footage totaling 10% of the parking lot area was included in each land use. Square footages for the parking lot and landscaping areas are shown in Table 2-10.

Table 2-10. Phase 3 Construction Land Use Information

Plan Land Use Designation	CalEEMod Land Use Subtype	Land Use Size (acres)a	Building Space (square feet)
Green Industrial	Industrial – General Heavy Industry	8,949	4,872,530
Manufacturing	Industrial – Manufacturing	2,608	2,840,550
Logistics	Industrial – Manufacturing	633	826,604
Playas Restoration	Industrial – General Heavy Industry	2,017	219,649
	Total	**12,439**	**8,759,333**

Notes: See Appendix A, Construction CalEEMod Files, for detailed land use figures. CalEEMod = California Emissions Estimator Model.
[a] Land uses were input into CalEEMod based on building square footage.

The construction equipment mix and vehicle trips used for estimating the project-generated construction emissions are shown in Table 2-11. For emissions modeling purposes, it was assumed that all construction phases would occur simultaneously and would span the entire 10-year period. For the analysis, it was assumed that heavy construction equipment would be operating at the site 5 days per week (22 days per month) during proposed project construction.

[6] The California Emissions Estimator Model (CalEEMod) provides emission factors for off-road equipment only through the year 2050. As a result, construction activities projected to occur beyond 2050 were conservatively modeled as if they would occur in 2050. Although this assumption does not reflect future technological advancements or regulatory changes, it represents a conservative approach, as emissions from equipment used in earlier years are generally expected to be higher, given that emission standards are anticipated to become more stringent over time.

Table 2-11. Phase 3 Construction Information

Construction Phase	One-Way Vehicle Trips			Equipment

Notes: See Appendix A, Construction CalEEMod Files, for detailed information. Table 2-11 represents total construction information for Phase 3, aggregating the equipment list and trip counts from both model runs for Phase 3.
The equipment listed in Table 2-11 reflects Tier 4 Final engine tier and dust control requirements per Program HP-7 and Policy HP-18.

As in Phases 1 and 2, demolition activity during Phase 3 was conservatively estimated to include the demolition and export of 10,000 square feet of building debris per year. This demolition would require trucks hauling debris from the project site; hauling for demolition export is reflected in the truck trip figures included in Table 2-11.

Phase 3 would also require earthwork and material movement (i.e., import and export) of existing land. In the absence of project specifics, a conservative estimate of 250,000 cubic yards was used for both import and export, based on site acreages. This material movement would require hauling to and from the project site; hauling for grading export is reflected in the truck trip figures included in Table 2-11.

Phase 3 would also require the paving of project site areas for parking, circulation, etc. In the absence of project specifics, paved area was calculated by subtracting the building area and landscape area from the total acreage. It was conservatively assumed that 100% of the paved area would be composed of asphalt.

Roadways and Infrastructure Construction

Roadway network and infrastructure construction activities for the project were modeled in CalEEMod using the Linear land use type. The land use subtypes included road construction, road widening, and bridge/overpass construction. For the purposes of modeling, it was assumed that roadway network construction would increase in tandem with the building square footage growth for each Phase. Buildout of roadways and infrastructure construction assumptions, including phasing and equipment information, are based on CalEEMod default values and included below in Table 2-12.

Table 2-12. Roadways and Infrastructure Construction Assumptions

Construction Phase	One-Way Vehicle Trips			Equipment

Notes: See Appendix A, Construction CalEEMod Files, for detailed information.
The equipment listed in Table 2-12 reflects Tier 4 Final engine tier and dust control requirements per Program HP-7 and Policy HP-18.

Phase 1 construction would feature approximately 14 miles of new roads constructed, 20 miles of roads widened, and 1.3 acres of bridge and overpass constructed. As a result of the associated material movement, Phase 1 roadway construction would result in approximately 50,000 cubic yards of material export during the Grubbing and Land Clearing; Grading and Excavation; and Drainage, Utilities, and Subgrade phases, , requiring haul trucks for each phase as shown in Table 2-12. Based on the total paved area to be constructed during Phase 1, approximately 92 one-way haul truck trips per day would be required during the paving phase. Furthermore, the roadway construction process would include the striping or coating of approximately 918,000 square feet of paved area, or 6% of the total paved area.

Phase 2 construction would feature approximately 8 miles of new roads constructed, 11 miles of roads widened, and 0.7 acres of bridge and overpass constructed. As a result of the associated material movement, Phase 2 roadway construction would result in approximately 20,000 cubic yards of material export during the Grubbing and Land Clearing; Grading and Excavation; and Drainage, Utilities, and Subgrade phases, requiring haul trucks for each phase as shown in Table 2-12. Based on the total paved area to be constructed during Phase 2, approximately 52 one-way haul truck trips

per day would be required during the paving phase. Furthermore, the roadway construction process would include the striping or coating of approximately 503,000 square feet of paved area, or 6% of the total paved area.

Phase 3 construction would feature approximately 5 miles of new roads constructed, 7 miles of roads widened, and 0.4 acres of bridge and overpass constructed. As a result of the associated material movement, Phase 3 roadway construction would result in approximately 15,000 cubic yards of material export during the Grubbing and Land Clearing; Grading and Excavation; and Drainage, Utilities, and Subgrade phases, , requiring haul trucks for each phase, as shown in Table 2-12. Based on the total paved area to be constructed during Phase 3, approximately 36 one-way haul truck trips per day would be required during the paving phase. Furthermore, the roadway construction process would include the striping or coating of approximately 325,000 square feet of paved area, or 6% of the total paved area.

Geothermal Drilling Construction

The construction of geothermal facilities requires drilling for production wells and pipelines. Geothermal drilling would require off-road equipment, including drill rigs, that would be operational 24 hours per day and 7 days per week and would result in the movement of materials off site. All construction phases would include the construction of geothermal facilities; each facility's construction was assumed to span 18 months. Geothermal drilling construction assumptions are presented in Table 2-13.

Table 2-13. Geothermal Drilling Construction Assumptions

Construction Phase	One-Way Vehicle Trips			Equipment		
	Average Daily Worker Trips	Average Daily Vendor Truck Trips	Total Haul Truck Trips	Equipment Type	Quantity	Usage Hours
Phase 1						
Drilling	68	20	74	Generator Sets	8	24
				Pumps	2	24
				Bore/Drill Rigs	2	24
				Forklifts	10	24
				Aerial Lifts	2	24
				Tractors/Loaders/Backhoes	2	24
Phases 2–3

				Pumps	1	24
				Bore/Drill Rigs	1	24
				Forklifts	5	24
				Aerial Lifts	1	24
				Tractors/Loaders/Backhoes	1	24

Notes: See Appendix A, Construction CalEEMod Files, for detailed information.
The equipment listed in Table 2-13 reflects Tier 4 Final engine tier and dust control requirements per Program HP-7 and Policy HP-18.

Phase 1 would feature the construction of 11 new geothermal facilities over the whole 10-year period. Drilling would result in approximately 153,000 cubic yards import and 1,369,000 cubic yards of material export. Material import/export would require approximately 74 one-way haul truck trips per day during the geothermal construction period.

Phase 2 would feature the construction of four new geothermal facilities over a 6-year period. Drilling would result in approximately 56,000 cubic yards of material import and 498,000 cubic yards of material export. Material import/export would require approximately 44 one-way haul truck trips per day during the geothermal construction period.

Phase 3 would feature the construction of two new geothermal facilities over a 2-year period. Drilling would result in approximately 28,000 cubic yards of material import and 249,000 cubic yards of material export. Material import/export would require approximately 44 one-way haul truck trips per day during the geothermal construction period.

2.3.2.2 Operational Emissions

Operational Land Use Assumptions

Project-generated operational criteria air pollutant emissions were estimated for mobile, area, energy, off-road equipment, and stationary sources using CalEEMod and spreadsheet emissions calculations based on project-specific values, as well as CalEEMod default values by land use type and quantity when project specifics were not available. The project's year of full buildout is estimated to be 2055. In addition to full buildout of the project, two interim operational years were modeled to estimate project-generated emissions as the project is developed and implemented. The three operational scenarios were developed, as follows:

- **Phase 1 (2035):** Includes interim operations of land uses constructed through Phase 1 (2035)
- **Phase 2 (2045):** Includes interim operations of land uses constructed through Phase 1 and Phase 2 (2045)
- **Total Buildout (2055):** Includes buildout operations of land uses constructed through Phase 1, Phase 2, and Phase 3 (2055)

Tables 2-14 through 2-16 provide a summary of the land use inputs included in the CalEEMod modeling for Phases 1, 2, and buildout of the project, with additional details provided in Appendix B, Operational CalEEMod Files. Each land use was modeled in CalEEMod as its own individual model run. Land use information was determined based on the cumulative percent of primary or secondary allowable uses within each land use designation.

Parking

For land uses anticipated to include building area, an associated parking lot was assumed based on the type of land use. For land uses anticipated to necessitate more vehicle trips and a higher ratio of paved areas, such as manufacturing, transit, commercial, and warehouse uses, the associated parking lot square footage was assumed to be 5 times the building square footage. For all other land uses anticipated to include building space, the associated parking lot was assumed to be 2 times the building square footage. An exception to this assumption was the Parks land use, which was assumed to include parking area that would be 10% of the total lot square footage. Land uses that are not anticipated to include building space (i.e., Water Storage Facility, Outdoor Storage,

and EV Charging Stations) are modeled as parking lots in CalEEMod and do not have additional parking lots associated with them.

Landscaping

For land uses anticipated to include building area, the landscaping square footage was assumed to be 10% of the associated parking lot square footage. An exception to this assumption was the Parks land use, which was assumed to include a landscaping area that would be 90% of the total lot square footage. For land uses that are not anticipated to include building space (i.e., Water Storage Facility and Outdoor Storage), landscaping area was assumed to be 2% of the total lot square footage. For the EV Charging Stations land use, landscaping area was assumed to be 10% of the total lot square footage.

Table 2-14. Operational Land Use Assumptions – Phase 1 – 2035

Land Use Type	CalEEMod Land Use Type	CalEEMod Land Use Subtype	Building Square Footage	Land Use Acreage	Parking Lot Area (square feet)	Landscape Area (square feet)

Source: Appendix B, Operational CalEEMod Files.
Notes: CalEEMod = California Emissions Estimator Model.
[a] Based on the South Coast Air Quality Management District High-Cube Warehouse Business Survey, it was assumed that 15% of floor space is designated for cold storage (SCAQMD 2014).

Operational Emission Source Assumptions

The calculations of mobile, area, energy, off-road equipment, and stationary source criteria air pollutant emissions are explained below.

Mobile Sources

Mobile sources for the land uses developed under the LVSP would be residents, visitors, customers, employees, and trucks traveling to and from the project sites. CalEEMod was used to estimate mobile source emissions for the projects under buildout of the LVSP in 2055 and additional interim operational scenarios, but project-specific input values were used where available, as explained below. However, the EMFAC models in CalEEMod only have emission factors through 2050. As such, the year 2050 was assumed for estimating mobile source emissions, which is considered conservative given increased electrification and fuel economy over time due to regulatory mandates and retirement of older equipment.

Consistent with the transportation analysis, trip rates were obtained from the Institute of Transportation Engineers (ITE) Trip Generation Manual, 11th edition.[7] The ITE 11th Edition Trip Generation Manual does not provide trip generation rates for a few unique land use designations within the LVSP (ITE 2021). Therefore, custom trip generation rates were developed for the proposed Green Industrial and Playas Renewables land use designations.

CalEEMod default emission factors representing the vehicle mix and emissions for 2050 were used for buildout of the project; for each interim scenario, the appropriate year was selected. As represented in CalEEMod, motor vehicles may be fueled with gasoline, diesel, or alternative fuels, such as electricity.

The default CalEEMod paved road percentage value was adjusted to 85%. All roads used by future developments projects within the Plan Area would be required to be paved, as described in Policy HP-19. Per ICAPCD guidance, a value of 85% accounts for the high levels of entrained dust generated from vehicle travel on paved roadways in the region.

General mobile source assumptions:

- **Vehicle Data.** Trip rates were estimated based on ITE trip rates and data provided by the applicant for the project. Default CalEEMod values were applied for trip lengths.
- **Fleet Mix.** Default CalEEMod values were applied.
- **Vehicle Emission Factors.** Default CalEEMod values were applied.
- **Road Dust.** The default CalEEMod paved road percentage values was adjusted to 85%. All roads used by future developments projects within the Plan Area would be required to be paved. Per ICAPCD guidance, a value of 85% accounts for the high levels of entrained dust generated from vehicle travel on paved roadways in the region.

[7] At the time of the Notice of Preparation, the most recent edition of the Institute of Transportation Engineers (ITE) Trip Generation Manual was the 11th Edition. Since then, the 12th Edition was released, on August 25, 2025, and may contain updated trip generation rates and methodologies relevant to future analyses.

Land uses with alternative mobile source assumptions:

- **Solar, Battery Energy Storage Systems (BESS), Substations, Floatovoltaics, Agrivoltaics, Water Storage Facility:** These land uses would only generate vehicle trips for occasional maintenance. It was conservatively estimated that an average of five workers traveling to the site each week (approximately 520 one-way trips per year) would be required for maintenance at each of these land uses. Assuming a distance of 24 miles per trip, mobile sources would generate approximately 12,514 vehicle miles traveled (VMT). The general mobile sources assumptions listed above were applied for the fleet mix, vehicle emission factors, and road dust inputs. See Appendix B for details.
- **Wholesale Distribution and Logistics and Warehousing:** The ITE trip rate for Land Use Code 154 (High-Cube Transload/Short-Term Storage) was used for both passenger vehicles and trucks. The passenger vehicle trip lengths were assumed to be CalEEMod default trip length of 24.4 miles for commercial-work trips (i.e., trips made by someone who is employed by the Warehouse land use) and assumed to be 55.3% of primary trips for a warehouse with cold storage and 72.5% of primary trips for a warehouse without cold storage. The heavy-duty truck trip lengths were based on the SCAQMD recommendation of 40 miles.[8] Heavy-duty-truck trips were assumed to be 44.7% of primary trips for a warehouse with cold storage and 27.5% of primary trips for a warehouse without cold storage. The mix of vehicle classifications for passenger vehicles and trucks is based on the fleet mix percentages from ITE Land Use Code 154. The general mobile sources assumptions listed above were applied for the vehicle emission factors and road dust inputs. See Appendix B for details.
- **Electrical Vehicle Charging Stations:** Mobile source emissions would result from passenger vehicles and truck traffic traveling to and from the facilities to charge their vehicles. However, combustion emissions are not estimated from the EV trips associated with the EV charging facilities because EVs do not generate combustion emissions. Particulate matter emissions would be generated from the EV trips from tire and brake wear, and these emissions are estimated and included in the analysis. For each operational scenario, the number of vehicle trips was estimated based on the size of the charging station, the type of chargers, the utilization of the chargers, and the mix of vehicle types expected to use the station. These estimates were guided by data and experience from similar projects. See Appendix B for details.

Area Sources

CalEEMod was used to estimate operational emissions from area sources, including emissions from consumer product use, architectural coatings, and landscape maintenance equipment. Emissions associated with natural gas usage in space heating, water heating, and stoves were calculated in the building energy use module of CalEEMod, as described in the following text.

Consumer products are chemically formulated products used by household and institutional consumers, including cleaning supplies, kitchen aerosols, cosmetics, toiletries, and pesticides/fertilizers used at city parks (CAPCOA 2022). Other paint products, furniture coatings, or architectural coatings are not considered consumer products (CAPCOA 2022). Consumer product VOC emissions are estimated in CalEEMod based on the floor area of residential and nonresidential buildings and on the default factor of pounds of VOC per building square foot per day. For the

[8] The average trip length for heavy-duty trucks was based on implementation of the Facility-Based Mobile Source Measures adopted in the South Coast Air Quality Management District (SCAQMD) 2016 AQMP. SCAQMD's Preliminary Warehouse Emission Calculations assumed a heavy-heavy-duty truck trip length of 39.9 miles (SCAQMD 2021). Therefore, the conservatively assumed trip length of 40 miles is used for this analysis.

recreational land uses represented as "city park," CalEEMod estimates VOC emissions associated with the use of pesticides and fertilizers based on square footage and pounds of VOC per square foot per day. For the Asphalt Surface land use, CalEEMod estimates VOC emissions associated with the use of parking surface degreasers based on a square footage of parking surface area and pounds of VOC per square foot per day.

VOC off-gassing emissions result from the evaporation of solvents contained in surface coatings, such as in paints and primers used during building maintenance. CalEEMod calculates the VOC evaporative emissions from application of nonresidential surface coatings based on the VOC emission factor, the building square footage, the assumed fraction of surface area, and the reapplication rate. The VOC emission factor is based on the VOC content of the surface coatings, and ICAPCD Rule 424 (Architectural Coatings) governs the VOC content for interior and exterior coatings. The model default reapplication rate of 10% of area per year is used. Consistent with CalEEMod defaults, it is assumed that the residential surface area for painting equals 2.7 times the floor square footage, and the nonresidential surface area for painting equals 2.0 times the floor square footage, with 75% assumed for interior surface coating and 25% assumed for exterior surface coating. For the other asphalt surfaces, the architectural coating area is assumed to be 6% of the total square footage, consistent with the supporting CalEEMod studies provided as an appendix to the CalEEMod User's Guide (CAPCOA 2022).

Landscape maintenance includes fuel combustion emissions from equipment such as lawn mowers, shredders/grinders, and leaf blowers, which are assumed to be gasoline-fueled. The emissions associated with landscape equipment use are estimated based on CalEEMod default values for emission factors (grams per square foot of nonresidential building space per day) and the number of summer days (when landscape maintenance would generally be performed) and winter days. The CalEEMod default value for the number of summer days was increased to 270 days because the project is in a desert region.

General area source assumptions:

- **Hearths.** Default CalEEMod values were applied.
- **Consumer Products.** Default CalEEMod values were applied.
- **Architectural Coating.** Default CalEEMod values were applied.
- **Landscape Equipment.** 270 summer days were assumed.

Energy Sources

As represented in CalEEMod, energy sources include emissions associated with building electricity and natural gas usage. Electricity use would contribute indirectly to criteria air pollutant emissions; however, the emissions from electricity use are only quantified for GHG emissions in CalEEMod because criteria pollutant emissions would occur at the site of power plants, which are not on the project site. However, natural gas combustion would occur at the project site itself, in association with equipment that uses natural gas.

In CalEEMod 2022.1, the default energy use from nonresidential land uses is based on 2019 consumption estimates from the California Energy Commission (CEC) 2018–2030 Uncalibrated Commercial Sector Forecast (Commercial Forecast), and the energy use from residential land uses is based on the 2019 Residential Appliance Saturation Survey (RASS). The Commercial Forecast and RASS datasets derive the energy intensities of different end-use categories for different land use subtypes for electricity demand forecast zones throughout the state. However, the energy use estimates are based on existing buildings and residences and are not representative of

those constructed in compliance with the energy efficiency requirements of the latest Title 24 Building Energy Efficiency Standards (e.g., the average residence surveyed in the RASS was constructed in 1974). Therefore, per Appendix D, Technical Source Documentation for Emissions Calculations, of the CalEEMod Version 2022.1 User Guide, "the default energy consumption estimates provided in CalEEMod based on the Commercial Forecast and RASS are very conservative, overestimating expected energy use compared to what would be expected for new buildings subject to the latest Energy Code with more stringent energy efficiency measures" (CAPCOA 2022).

Default CalEEMod values were applied for most land uses to calculate criteria air pollutant emissions associated with natural gas and electricity use. Consistent with CalEEMod defaults, the energy associated with parking lots for each land use was assumed to be fully electric, with no natural gas usage. For certain land uses, alternative energy source assumptions were applied in place of CalEEMod defaults, as described below.

Land uses with alternative energy source assumptions:

- **Solar, Substations, Agrivoltaics, Floatovoltaics:** Operation of these land uses would only consume electricity; no natural gas would be consumed. Default natural gas consumption was converted to electricity and is accordingly reflected within CalEEMod. CalEEMod default values were assumed for the amount of energy consumed subject to Title 24 standards.
- **Battery Energy Storage Systems:** BESS sites would only result in auxiliary energy consumption associated with BESS operations, including cooling, metering, controlling, and monitoring; no natural gas would be consumed. Auxiliary energy was assumed to account for 2% of the BESS energy capacity, annually. As such, during Phase 1, approximately 11,680 megawatt-hours (MWh) of auxiliary energy would be consumed annually by BESS sites. During Phase 2, approximately 14,600 MWh of auxiliary energy would be consumed annually. During Phase 3, approximately 18,980 MWh of auxiliary energy would be consumed annually.
- **Electric Vehicle Charging Stations:** EV charging stations would include direct current fast-charging infrastructure for low-density to high-density trucks, as well as personal vehicles; the charging stations would also house solar panels to generate electricity on site. The EV charging stations' electricity demand during each operational scenario was calculated based on a constant of kilowatt-hours (kWh) per acre estimated using previous project experience. Additionally, it was assumed that 10% of the electricity demand would be generated by the on-site solar panels. After accounting for the solar power offsets, the EV charging stations developed in Phase 1 would demand approximately 18.0 million kWh of electricity from the grid, Phase 2 stations would demand approximately 26.1 million kWh of grid electricity, and EV charging stations at total project buildout would demand approximately 28.5 million kWh of grid electricity.
- **Geothermal:** Operation of these land uses would only consume electricity; no natural gas demand was assumed. Default natural gas consumption was converted to electricity and is accordingly reflected within CalEEMod. CalEEMod default values were assumed for the amount of energy consumed subject to Title 24 standards.
- **Data Centers:** Operation of data centers would only consume electricity; no natural gas would be consumed. Based on similar projects, it was assumed that data centers would consume 100 MW per 500,000 building square feet, operating 24 hours per day and 365 days per year. As such, during Phase 1, approximately 3,852,579 MWh of electricity would be consumed annually by data centers. During Phase 2, approximately 4,703,325 MWh of electricity would be consumed annually. During Phase 3, approximately 6,301,225 MWh of electricity would be consumed annually.

Off-Road Equipment

- CalEEMod was used to estimate emissions from operational off-road equipment. The implementation of Program HP-7 would require that all diesel-fueled off-road equipment meet EPA-rated Tier 4 Final engines consistent with CCR Title 13 Section 2449 et seq. Electric or net-zero-emissions equipment is preferred when commercially available and would also meet this requirement. As such, all operational off-road equipment was modeled as Tier 4 Final in CalEEMod. Land uses and their associated off-road equipment assumptions are provided below. Equipment was scaled up based on the growth of building square footage in each phase. See Appendix B for additional details.
- Land uses with off-road equipment assumptions:
- BESS: During maintenance, the project may require the movement or replacement of battery enclosures during the lifetime of the project. As such, the use of a crane was assumed to assist the lifting and movement of the BESS containers. CalEEMod was used to estimate emissions of the crane, assuming 8 hours of operation every 3 years.
- Mineral Recovery, Processing, and Production: Based on the square footage of building space permitted by this land use, forklifts were assumed during operations, based on similar projects. CalEEMod was used to estimate emissions of the forklifts, assuming 8 hours of operation per day for 365 days per year.
- Green Hydrogen: Based on the square footage of building space permitted by this land use, aerial lifts and skid steer loaders were assumed during operations, based on similar projects. CalEEMod was used to estimate emissions of the aerial lifts and skid steer loaders, assuming 1 hour of operation per day for 260 days per year.
- Water Storage Facility: Pumps were assumed during operations. CalEEMod was used to estimate emissions of the pumps, assuming 8 hours of operation per day for 365 days per year.
- Business Industrial Parks, Battery Manufacturing, Automobile Manufacturing, Manufacturing of Green Industrial Equipment: Based on the maximum square footage of building space permitted by these land uses, on-site operational equipment was modeled in CalEEMod assuming 0.12 forklifts per 1,000 square feet operating at 8 hours a day for 260 days of the year (SCAQMD 2014).
- Wholesale Distribution, Logistics and Warehousing: Based on the maximum square footage of building space permitted by these land uses, on-site operational equipment was modeled in CalEEMod assuming 0.12 forklifts per 1,000 square feet and 3.6 yard trucks per 1 million square feet (modeled as rough-terrain forklift in CalEEMod) operating at 24 hours a day for 365 days of the year (SCAQMD 2014).

Table 2-17 shows the off-road equipment assumption by land use by phase for the project.

Table 2-17. Off-Road Equipment Assumptions by Land Use

Land Use Type	Off-Road Equipment Type	Hours per Day	Days per Year	Horsepower	Phase 1 Quantity	Phase 2 Quantity	Phase 3 Quantity

Notes: The equipment listed in Table 2-17 was modeled to be Tier 4 within CalEEMod, as required per Program HP-7.

Stationary Equipment

CalEEMod was used to estimate emissions from operational stationary equipment (i.e., emergency generators, fire pumps, and boilers). CalEEMod default emission factors were assumed for the equipment type based on its horsepower. Land uses and their associated emergency generator assumptions are provided in Table 2-18. All emergency generators were assumed to operate for 1 hour per day and 50 hours per year for routine maintenance and testing. See Appendix B for additional details.

Table 2-18. Emergency Generator Assumptions by Land Use

Source: Appendix B, Operational CalEEMod Files.

For the Green Hydrogen land use, in addition to the emergency generators, 335-horsepower diesel fire pumps were assumed to operate for 1 hour per day and 50 hours per year; compressed natural gas boilers with a rating of 10 were assumed to operate with a daily heat input of 240 and an annual heat input of 83,220. In Phases 1 and 2, three diesel fire pumps and three boilers were assumed, and in Phase 3, four diesel fire pumps and four boilers were assumed.

For all other stationary equipment, emissions were calculated in a spreadsheet model. Land uses with alternative stationary equipment assumptions are provided below. See Appendix B for additional details.

Land uses with stationary equipment assumptions outside of CalEEMod:

- **Geothermal/Mineral Recovery, Processing, and Production:** PM_{10} emissions would result from operation of the cooling towers associated with the geothermal and mineral recovery facilities land uses as a result of the total dissolved solids in the circulating water that are carried out with the water entrained in being discharged from the tower (SCAQMD 2022). SCAQMD's Guidelines for Calculating Emissions from Cooling Towers was used to estimate PM_{10} emissions related to cooling towers (SCAQMD 2022). Based on other recent geothermal plants in Imperial County of a scale similar to what is planned for the LVSP, approximately 330 million gallons of water was assumed to be circulated per year for the purposes of estimating PM_{10} emissions. Based on information from the County, 11 cooling towers were assumed to be operational in Phase 1, 15 in Phase 2, and 17 in Phase 3 of the LVSP.
- **Battery Manufacturing:** Criteria air pollutant emissions would result from the use of a variety of stationary source equipment used during the battery manufacturing process, including but not limited to spray booths, ovens, boilers, chillers, and furnaces, Given the variety of potential stationary sources and the limited information on stationary source equipment for the future development of automobile manufacturing within the LVSP area, an emissions inventory from an existing automobile facility was utilized to calculate potential criteria for air pollutant emissions for potential stationary sources by scaling the existing emissions

inventory relative to the proposed automobile manufacturing facilities building square footage for each phase of operation.

- **Anaerobic Digester:** Criteria air pollutant emissions would result from the stationary source equipment, including boilers and biogas flares. Stationary source equipment data was taken from a representative facility in Imperial County. Emissions were calculated using Santa Barbara County Air Pollution Control District's (SBCAPCD's) emission calculation spreadsheets for boilers and flares, which use AP-42 emission factors.
- **Wastewater Treatment Plant:** The wastewater treatment plants would result in VOC off-gassing during treatment processes. VOC and TAC emissions were estimated based on VOC emission factors for the project's wastewater treatment plant and lift station based on San Diego Air Pollution Control District source test data[9] and assuming an annual throughput of about 6,570 million gallons per year in Phase 1, 8.395 million gallons per year in Phase 2, and 11,680 million gallons per year in Phase 3, with TAC speciation per the San Joaquin Valley Air Pollution Control District (SJVAPCD) Emissions from Publicly Owned Treatment Works or Wastewater Treatment Plants calculator.
- **Automobile Manufacturing.** Criteria air pollutant emissions would result from the use of a variety of stationary source equipment used during the automobile manufacturing process, including but not limited to spray booths, ovens, boilers, chillers, and furnaces, Given the variety of potential stationary sources and the limited information on stationary source equipment for the future development of automobile manufacturing within the LVSP area, an emissions inventory from an existing automobile facility was utilized to calculate potential criteria air pollutant emissions for potential stationary sources by scaling the existing emissions inventory relative to the proposed automobile manufacturing facilities' building square footage for each phase of operation

2.3.2.3 Health Risk Assessment

A HRA was performed to evaluate potential health risks associated with construction and operation of the LVSP. The following discussion summarizes the dispersion modeling and HRA methodology; supporting HRA documentation, including detailed assumptions, is presented in Appendix E, Health Risk Assessment.

For risk assessment purposes, PM_{10} in diesel exhaust is considered DPM, originating mainly from off-road equipment operating at a defined location for a given length of time at a given distance from sensitive receptors. Less intensive, more dispersed emissions result from on-road vehicle exhaust (e.g., heavy-duty diesel trucks). For the construction HRA, the CalEEMod scenario was adjusted to reduce diesel truck one-way trip distances to 10 miles to estimate emissions from truck pass-by at proximate receptors.

Air dispersion modeling was performed using EPA's American Meteorological Society/Environmental Protection Agency Regulatory Model (AERMOD) Version 24142 modeling system (computer software). The HRA followed the Office of Environmental Health Hazard Assessment 2015 guidelines (OEHHA 2015) to calculate the health risk impacts at all proximate receptors (on site and off site), as further discussed below. The dispersion modeling included the use of standard regulatory default options. AERMOD parameters were selected consistent with SCAQMD and EPA guidance and identified as representative of the project site and project activities. Principal parameters of this modeling are presented in Table 2-19.

[9] Emissions testing for Encina 1991/1993 and Point Loma 1990/1996 wastewater treatment facilities.

Table 2-19. AERMOD Principle Parameters – Health Risk Assessment

Parameter	Details
Meteorological Data	AERMOD-specific meteorological data for the Imperial County Airport air monitoring station (No. 3144) was used for the dispersion modeling. A meteorological data set from 2015 through 2018 and 2021 was obtained from the California Air Resources Board in a preprocessed format suitable for use in AERMOD (CARB 2025k).
Urban versus Rural Option	The rural option was selected due to the predominant area around the Lithium Valley Specific Plan in accordance with the Auer method for classifying a site as urban or rural as specified in the U.S. Environmental Protection Agency's 40 CFR Part 51, Appendix W.
Terrain Characteristics	The elevation of the site is 200 feet below sea level, and the project site is predominantly flat.
Elevation Data	Digital elevation data were imported into AERMOD, and elevations were assigned to receptors and emission sources, as necessary. Digital elevation data were obtained through the AERMOD View in the United States Geological Survey's National Elevation Dataset format with a resolution of 1 degree (approximately 30 meters).
Source Release Characterizations	Area sources were used to model dispersion of pollutants for each phase of construction and operation due to uncertainty about actual source locations and their actual release parameters. A release height of 11.2 feet was assumed for all area sources. Road and rail emissions were modeled using line volume sources. For roads, a plume height of 6.8 meters, plume width of 8.6 meters, and release height of 3.4 meters was assumed (SBCAPCD 2025). For rail sources, a plume height of 9.7 meters, plume width of 4.05 meters, and release height of 4.85 meters was assumed (Port of Stockton 2021).

Source: See Appendix E, Health Risk Assessment.
Notes: AERMOD = American Meteorological Society/Environmental Protection Agency Regulatory Model.

Discrete receptors were placed over residences in close proximity to the LVSP, and a uniform Cartesian grid of 100-meter spacing was placed over residential neighborhoods in close proximity to the LVSP. There would be on-site receptors during construction and operation of the LVSP, namely residences. There would be temporary housing during construction of each phase. A uniform cartesian grid of 100-meter spacing was placed over phases during construction to represent temporary housing. Permanent housing is also included in the LVSP. A uniform cartesian grid of 100-meter spacing was placed over phases to represent permanent housing. Each phase of construction was modeled separately in AERMOD to account for the movement of temporary residential receptors.

AERMOD was run with all sources emitting unit emissions (1 gram per second) to obtain the necessary input values for CARB's Hotspots Analysis and Reporting Program Version 2. The line of volume sources and area sources were partitioned evenly based on the emission rate of 1 gram per second. The ground-level concentration plot files were then used to estimate the long-term cancer health risk to an individual, as well as the noncancerous acute and chronic health indices.

Cancer risk is defined as the increase in probability (chance) of an individual developing cancer due to exposure to a carcinogenic compound, typically expressed as the increased chances in one million. Maximum Individual Cancer Risk is the estimated probability of a maximally exposed individual potentially contracting cancer as a result of exposure to TACs over a period of 30 years for residential receptor locations. For the construction HRA, the TAC exposure period was assumed to be from third trimester of pregnancy for 10 years for all off-site receptor locations for each phase (i.e., 10 years is the assumed duration of project construction). For on-site exposure, the duration

was assumed to be 10 years for the temporary housing receptors. The permanent housing in Phase 1 would be exposed to 20 years of construction emissions from Phases 2 and 3.

Additionally, the 2022 Title 24 Standards require Minimum Efficiency Reporting Value (MERV) 13 air filters in new construction, which help to capture outdoor air particles. MERV 13 filters have been demonstrated to remove approximately 90% of PM from intake air (Singer et al. 2016). As such, on-site permanent residential health risk assumes the use of MERV 13 filters.

The Office of Environmental Health Hazard Assessment has also established noncarcinogenic risk parameters for use In HRAs because some TACs increase noncancerous health risk due to long-term (chronic) exposures, and some TACs increase noncancerous health risk due to short-term (acute) exposures. Chronic and acute exposure is evaluated in the HRA. Noncarcinogenic risks are quantified by calculating a hazard index, expressed as the ratio between the ambient pollutant concentration and its toxicity or reference exposure level, which is a concentration at or below which health effects are not likely to occur. The chronic hazard index is the sum of the individual substance chronic hazard indices for all TACs affecting the same target organ system. A hazard index of less than 1 means that adverse health effects are not expected.

2.4 Impact Analysis

2.4.1 Would the project conflict with or obstruct implementation of the applicable air quality plan?

ICAPCD Clean Air Plans

The Plan Area is located within the jurisdictional boundaries of ICAPCD, which is responsible for developing and implementing the clean air plans for attainment and maintenance of the NAAQS and CAAQS in the SSAB, including the 2018 PM_{10} Plan and the 2017 Ozone SIP.

The Plan Area is a KGRA, which supports site selection for renewable energy and mineral extraction facilities. The area includes portions of the Salton Sea, agricultural zones, open space, and conservation areas—regions that would require development of infrastructure such as roadways, utilities, and other services to support the County's vision for the area. The Imperial County Land Use Ordinance has regulations for agricultural land that state that "no land shall be removed from the Agricultural designation except for annexation to a city, where needed for use by a public agency, for geothermal purposes, where a mapping error may have occurred or where a clear long-term economic benefit to the County can be demonstrated through the planning and environmental review process."

The basis for the air quality plans is the SCAG population growth projections, which are based in part on the land uses established by local General Plans. In the event a project would result in development that results in greater than anticipated growth projections, the project would result in air pollutant emissions that may not have been accounted for in the air quality plans and thus may obstruct or conflict with the air quality plans. As described below, ICAPCD has implemented plans for meeting state and federal standards of nonattainment pollutants. Relatedly, ICAPCD's air quality attainment plans are based, in part, on regional population and employment projections from SCAG, which is the designated metropolitan planning organization (MPO) for Imperial County.

Similarly, the County 2017 Ozone SIP relies primarily on the land use and population projections provided by SCAG and the CARB on-road emissions forecast as a basis for vehicle emission forecasting (ICAPCD 2017a). The SIP relied on growth projections in SCAG's 2016–2040 RTP/SCS (SCAG 2016). SCAG estimated that unincorporated Imperial County had 16,400 jobs in 2012 and would have 32,300 jobs in 2040, for an additional 15,900 jobs, or 567 jobs per year. Similarly, SCAG estimated that unincorporated Imperial County had a population of 37,700 in 2012 and would have a population of 70,300 in 2040, for an additional 32,600 residents, or 1,165 residents per year.

The LVSP would create an estimated 40,000 jobs in total, and 10,000 of these positions would be temporary, associated primarily with construction, installation, and infrastructure development. However, the lasting impact on population growth would be driven by the estimated 30,000 permanent positions in industries such as renewable energy, lithium extraction, manufacturing, logistics, and commercial sectors. Development of Phase 1 (2035) would create an estimated 15,952 permanent jobs, Phase 2 (2045) would create an additional 11,029 permanent jobs, and Phase 3 (2055) would create an additional 5,575 permanent jobs, for a total of 32,556 jobs. In addition, the LVSP would create an estimated 278 permanent dwelling units at buildout.

Therefore, development facilitated by the LVSP is expected to exceed the projected employment growth in Imperial County, for each phase and at buildout, with the creation of approximately 40,000 jobs, including both temporary and permanent positions. In addition, buildout of the LVSP would create a denser land use pattern by increasing development and employment in the region compared to the existing agricultural uses. As such, the LVSP's increase in employment may conflict with the regional growth projections used to prepare the AQMPs for the SSAB (2018 PM_{10} Plan and 2017 Ozone SIP).

However, development that occurs from implementation of the project would be consistent with SCAG's regional goals of providing infill housing, improving the jobs-to-housing balance, and integrating land uses near major transportation corridors. More specifically, the LVSP includes specific goals and policies to support these regional goals and in turn, improve air quality, as described in Section 4.3.2. These goals and policies are related to planning for optimization of circulation and transportation, sustainable land use and transportation planning, and renewable energy production. Nonetheless, due to the substantial growth in employment, the LVSP may conflict with the regional growth projections used to prepare the applicable air quality plan. Therefore, impacts related to the project's potential to conflict with regional growth projections would be **significant** prior to mitigation.

Implementation of Mitigation Measure (MM)-POP-1 would ensure that the appropriate residential and employment growth projections of the Plan Area would be incorporated into the next SCAG RTP/SCS (anticipated to be the 2028 RTP/SCS). Because SCAG is in process of preparing their next RTP/SCS, and ICAPCD has not identified the next target year for updating the AQMP, there is an anticipated interim period where the SCAG RTP/SCS growth projections and the ICAPCD air quality plans do not reflect the appropriate residential and employment growth at the Plan Area; however, this will eventually be resolved with updates of both plans. Nonetheless, the LVSP would still conflict with the regional growth projections used to prepare the AQMPs for the SSAB. Based on the above considerations, the project would conflict with or obstruct implementation of the applicable air quality plan, and impacts would be **significant and unavoidable**.

Imperial County Air Pollution Control District Community Emissions Reduction Plans

As described in Section 4.3.2, the Imperial County North End Phase 1 Community CERP outlines strategies to reduce emissions in the community (ICAPCD 2025).

The CERP identified Strategy T-1, School Bus Replacement and Infrastructure, which would seek funding opportunities to replace diesel school buses with electric buses and to develop the associated charging infrastructure (ICAPCD 2025). As described in Section 4.3.2, LVSP Policy CT-13, Diverse Modes of Transportation, would require the County to support the diversification of travel modes used in Lithium Valley to increase employee trips made by bicycle or public transit, including new mobility types like electric shuttles, electric vanpool/carpool, electric carsharing service, docked bikeshare, and e-scooter share. Furthermore, the LVSP would support the development of EV charging infrastructure, which would be inclusive of trucks and buses.

In addition, CERP Strategy T-2, Promote Public Transportation, would advocate for service improvements in the North End, such as more frequent stops, reduced fares, and an improved schedule (ICAPCD 2025). Policy CT-19 through Policy CT-23 would be implemented in the LVSP to enhance transit access and connectivity of the project within the County.

The CERP identified that the largest sources of directly emitted $PM_{2.5}$ emissions in the community are from fugitive windblown dust (60%) and dust from vehicle travel on unpaved roads (10%) (ICAPCD 2025). The LVSP would implement Policy HP-18, Dust Suppression, which requires dust control measures that go beyond the minimum requirements of ICAPCD Regulation VIII Rules 800–806 and would reduce project-generated construction dust. As described above, the LVSP would also implement Policy HP-19, Paved Roads, which would reduce dust generation from vehicle travel on unpaved roads.

Furthermore, under Strategy M-1, Fund Paving Projects, ICAPCD proposes to fund paving projects within the North End community (ICAPCD 2025). The LVSP would implement Policy HP-19, Paved Roads, which would require future development within the Plan Area to be accessible by a paved road. This feature would reduce dust generation from vehicle travel on unpaved roads.

Overall, the policies within the LVSP would support the applicable reduction measures outlined within the Imperial County North End Phase 1 Community CERP to reduce emissions and potential health risk to sensitive groups. Therefore, the LVSP would not conflict with the applicable portions of the CERP, and the project's potential impact would be **less than significant**.

Furthermore, under Strategy T-3, Idling Education and Outreach, the ICAPCD proposes to partner with CARB to conduct education and outreach to reduce the amount of idling in the North End Phase 1 Community (ICAPCD 2025). The LVSP would implement MM-AQ-3, Limit Truck and Equipment Idling During Construction; MM-AQ-7, Idling Time Restriction; and MM-AQ-8, Anti-Idling Implementation Measures, which would further reduce the idling time of heavy-duty trucks during construction and operations.

Summary

Based on the above considerations, the project would exceed the growth forecasts used to develop ICACPD's attainment plans. Thus, the project would potentially conflict with or obstruct the applicable air quality plan prior to mitigation, and the impact would be **significant**. Implementation of MM-POP-1, SCAG Coordination and Inclusion in Regional Planning, would ensure that the appropriate residential and employment growth projections of the Plan Area would be incorporated into the next SCAG RTP/SCS (anticipated to be the 2028 RTP/SCS). Nonetheless, the LVSP would still conflict with the regional growth projections used to prepare the AQMPs for the SSAB, and the impact would be **significant and unavoidable**.

Regarding the Imperial County North End Phase 1 Community CERP, the project would not conflict with the applicable portions of the CERP.

Therefore, the project's potential to conflict with or obstruct implementation of the applicable air quality plan would be **significant and unavoidable.**

Level of Significance Before Mitigation

Impacts would be **significant** before mitigation.

Mitigation Measures

The LVSP would implement MM-AQ-1 through MM-AQ-12 and MM-TRA-1 through MM-TRA-4, as detailed in Section 2.4.2 below, and MM-POP-1, as follows.

MM-POP-1 SCAG Coordination and Inclusion in Regional Planning. Prior to recordation of the first final map or issuance of the first development permit (whichever occurs first), the County of Imperial shall submit the final adopted Lithium Valley Specific Plan to the Southern California Association of Governments for inclusion in regional planning documents, including the Regional Transportation Plan/Sustainable Communities Strategy and the Regional Housing Needs Assessment, as applicable. This action shall ensure that the employment and associated population growth facilitated by the Lithium Valley Specific Plan is recognized and incorporated into regional forecasts.[10]

MM-POP-1 is not a quantifiable measure.

Level of Significance After Mitigation

Based on the above considerations, the project would exceed the growth forecasts used to develop ICACPD's attainment plans. Thus, the project would potentially conflict with or obstruct the applicable air quality plan prior to mitigation. Implementation of MM-POP-1 would ensure that the appropriate residential and employment growth projections of the Plan Area would be incorporated into the next SCAG RTP/SCS (anticipated to be the 2028 RTP/SCS). Nonetheless, the LVSP would still conflict with the regional growth projections used to prepare the AQMPs for the SSAB.

Regarding the Imperial County North End Phase 1 Community CERP, the project would not conflict with the applicable portions of the CERP,

Therefore, the project's potential to conflict with or obstruct implementation of the applicable air quality plan would be **significant and unavoidable.**

[10] The updated information provided to SCAG is anticipated be used by ICAPCD to update the AQMP. The applicant shall prepare and submit a letter notifying ICAPCD of this revised forecast for use in the future updates to the plan, as required.

2.4.2 Would the project result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard?

By its nature, air pollution is largely a cumulative impact. The nonattainment status of regional pollutants is a result of past and present development, and ICAPCD develops and implements plans for future attainment of ambient air quality standards. Based on these considerations, project-level thresholds of significance for criteria pollutants are used in the determination of whether a project's individual emissions would have a cumulatively considerable contribution to air quality. If a project's emissions would exceed the applicable significance thresholds, it would have a cumulatively considerable contribution. Conversely, projects that do not exceed the project-specific thresholds are generally not considered to be cumulatively significant.

As discussed previously, the SSAB has been designated a national nonattainment area for O_3 and PM_{10} and a California nonattainment area for O_3, PM_{10}, and $PM_{2.5}$. Construction and operation of the project would result in emissions of criteria air pollutants, which may result in a cumulatively considerable increase in emissions of criteria air pollutants for which the SSAB is designated as nonattainment under the NAAQS or CAAQS. The following discussion quantitatively evaluates potential short-term construction and long-term operational impacts that would result from implementation of the project.

Construction Emissions

Proposed construction activities would result in the temporary addition of pollutants to the local airshed caused by on-site sources (i.e., off-road construction equipment, soil disturbance, and VOC off-gassing from architectural coatings and asphalt pavement application) and off-site sources (i.e., on-road haul trucks, delivery trucks, and worker vehicle trips). Construction emissions can vary substantially from day to day, depending on the level of activity, the specific type of operation, and, for dust, the prevailing weather conditions. Therefore, such emissions levels can only be estimated, with a corresponding uncertainty in precise ambient air quality impacts.

As discussed in Section 2.3.2.1, Construction Emissions, criteria air pollutant emissions associated with temporary construction activity were quantified using CalEEMod, based on the construction information presented in Table 2-20, including phase type, duration, and sequencing, were based on CalEEMod defaults for a compressed 10-year construction period for each phase of the project and are intended to represent a reasonable scenario based on the best information available. Default values provided in CalEEMod were used where detailed project information was not available.

Implementation of the project would generate criteria air pollutant emissions from entrained dust, off-road equipment, vehicle emissions, architectural coatings, and asphalt pavement application. Entrained dust results from the exposure of earth surfaces to wind from the direct disturbance and movement of soil, resulting in PM_{10} and $PM_{2.5}$ emissions. The project would implement Policy HP-18, Dust Suppression, which goes beyond the requirements of ICAPCD Regulation VIII to control dust emissions generated during construction activities. Per Policy HP-18, construction practices that were assumed to be employed to reduce fugitive dust emissions and were quantified in CalEEMod include watering of the active sites three times per day depending on weather conditions,

watering of unpaved roads twice per day, limiting vehicle speeds on unpaved roads to 25 miles per hour, and sweeping paved roads once per month.

Internal combustion engines used by construction equipment, haul trucks, vendor trucks (i.e., delivery trucks), and worker vehicles would result in emissions of VOCs, NO_x, CO, PM_{10}, and $PM_{2.5}$. The project would implement Program HP-7, Equipment Exhaust Minimization, which includes specific engine efficiency requirements for off-road equipment used during construction. The application of architectural coatings, such as exterior and interior paint and other finishes, and application of asphalt pavement would also produce VOC emissions; however, the contractor would be required to procure architectural coatings from a supplier in compliance with the requirements of ICAPCD Rule 424 (Architectural Coatings).

Construction emissions were calculated for the estimated worst-case day over the construction period associated with each phase and reported as the maximum daily emissions estimated during each year of construction (2025 through 2054). Table 2-20 presents the estimated maximum daily construction emissions generated during construction of the project. "Summer" emissions are representative of the conditions that may occur during the O_3 season (May 1 to October 31), and "winter" emissions are representative of the conditions that may occur during the balance of the year (November 1 to April 30). Reductions to construction emissions from the implementation of Program HP-7 and Policy HP-18 are reflected in Table 2-20. Details of the emission calculations are provided in Appendix A.

ICAPCD Threshold	75	100	550	150	150	55
Threshold Exceeded?	**Yes**	**Yes**	**Yes**	No	**Yes**	**Yes**

Source: Appendix A, Construction CalEEMod Files.
Notes: VOC = volatile organic compound; NO_x = oxides of nitrogen; CO = carbon monoxide; SO_x = sulfur oxides; PM_{10} = coarse particulate matter; $PM_{2.5}$ = fine particulate matter; ICAPCD = Imperial County Air Pollution Control District.
Emissions reflect the implementation of Program HP-7 and Policy HP-18 during construction.

As shown in Table 2-20, emissions resulting from project construction would exceed the criteria pollutant thresholds established by ICAPCD for VOC, NO_x, CO, PM_{10}, and $PM_{2.5}$ emissions. This impact would be **significant** without mitigation.

Several mitigation measures have been identified that would reduce the project's construction criteria air pollutant emissions to the extent feasible (see MM-AQ-1 through MM-AQ-4). However, the emission reduction benefits of these mitigation measures are not readily quantifiable, and thus, mitigated emissions are not presented herein. Further, the magnitude of emission reductions attributable to these mitigation measures is not expected to reduce project emissions attributable to operational activities below ICAPCD's numerical thresholds of significance.

Because the project-generated operational emissions of VOCs, NO_x, CO, PM_{10}, and $PM_{2.5}$ would exceed the ICAPCD thresholds, the project would potentially result in a cumulatively considerable increase in emissions of nonattainment pollutants. Therefore, the project's cumulative air quality impact from construction emissions would be **significant and unavoidable**.

Operational Emissions

Operation of the project would generate VOC, NO_x, CO, SO_x, PM_{10}, and $PM_{2.5}$ emissions from mobile sources, including vehicular traffic generated by residents, employees, customers, visitors, trucks, and trains; energy sources

from natural gas usage; area sources, including the use of landscaping equipment, consumer products, and architectural coatings, off-road equipment, and stationary equipment. As discussed in Section 2.3.2.2, Operational Emissions, pollutant emissions associated with long-term operations were quantified using CalEEMod and spreadsheet models using a combination of project-specific information and CalEEMod default values.

The LVSP would implement Program HP-7, which requires that all diesel-fueled off-road equipment shall meet EPA-rated Tier 4 Final engines consistent with 13 CCR Section 2449 et seq. Electric or net-zero-emissions equipment is preferred when commercially available and would also meet this requirement. In addition, the LVSP would implement Policy HP-19, Paved Roads, which requires the County to ensure that all future development projects within the Plan Area are accessible by a paved road prior to providing a certificate of occupancy.

Table 2-21 shows the maximum daily summer and winter criteria air pollutant emissions associated with interim project operation for each land use after Phase 1 construction (year 2035). "Summer" emissions are representative of the project operations anticipated to occur during the O_3 season (May 1 to October 31), and "winter" emissions are representative of the project operations anticipated to occur during the balance of the year (November 1 to April 30).Tables 2-21 through Table 2-24 include the emissions reductions resulting from the implementation of Program HP-7. Details of the emission calculations are provided in Appendix B.

Source: See Appendix B, Operational CalEEMod Files, for complete results.
Notes: VOC = volatile organic compound; NO_x = oxides of nitrogen; CO = carbon monoxide; SO_x = sulfur oxides; PM_{10} = coarse particulate matter; $PM_{2.5}$ = fine particulate matter; ICAPCD = Imperial County Air Pollution Control District.
<0.01 = reported value less than 0.01.
Emissions shown in Table 2-24 reflect the implementation of Program HP-7 and Policy HP-19 during operation.

As shown in Table 2-24, the project would exceed the numerical thresholds of significance established by ICAPCD for emissions of VOCs, NO_x, CO, and PM_{10} and $PM_{2.5}$; therefore, impacts are considered **significant without mitigation**.

Several mitigation measures have been identified that would reduce the project's operational criteria air pollutant emissions to the extent feasible (see MM-AQ-5 through MM-AQ-9). However, the emission reduction benefits of these mitigation measures are not readily quantifiable, and thus, mitigated emissions are not presented herein. Further, the magnitude of emission reductions attributable to these mitigation measures is not expected to reduce project emissions attributable to operational activities below ICAPCD's numerical thresholds of significance, as the emission exceedances primarily are attributable to mobile sources (i.e., vehicles) and stationary sources.

As discussed in Section 2.2.2.1, Criteria Air Pollutants, the SSAB has been designated as a national nonattainment area for O_3 and a California nonattainment area for O_3 and PM_{10}. The nonattainment status is the result of cumulative emissions from various sources of air pollutants and their precursors within the SSAB, including motor vehicles, off-road equipment, and commercial and industrial facilities. Construction and operation of the project would generate emissions of VOC and NO_x (which are precursors to O_3) and emissions of PM_{10} and $PM_{2.5}$. Because the project-generated operational emissions of VOCs, NO_x, CO, PM_{10}, and $PM_{2.5}$ would exceed the ICAPCD thresholds, the project would potentially result in a cumulatively considerable increase in emissions of nonattainment pollutants. Therefore, the project's cumulative air quality impact from operational emissions would be **significant and unavoidable**.

Overlap of Construction and Operation

During project development, project construction activities would occur concurrently with partial project operation. Therefore, for disclosure, a calculation of combined construction and operational emissions is provided. Estimated maximum daily criteria air pollutant emissions from the most intensive years of simultaneous construction and operational activities are presented in Table 2-25.

Source: Appendix B, Operational CalEEMod Files.

Notes: VOC = volatile organic compound; NO_x = oxides of nitrogen; CO = carbon monoxide; SO_x = sulfur oxides; PM_{10} = coarse particulate matter; $PM_{2.5}$ = fine particulate matter; ICAPCD = Imperial Valley Air Pollution Control District. Emissions shown in Table 2-26 reflect the implementation of Program HP-7 and Policy HP-18 during construction and Program HP-7 and Policy HP-19 during operation.

As shown in Table 2-25, and beginning in various calendar years, concurrent construction and operational activities would exceed the numerical thresholds of significance established by ICAPCD for operational emissions of VOCs, NO_x, CO, PM_{10}, and $PM_{2.5}$.

Concurrent construction and operational activities would result in emissions that would exceed the ICAPCD thresholds and result in a **significant impact**.

Several mitigation measures would reduce the project's construction and operational criteria air pollutant emissions, to the extent feasible (see MM-AQ-1 through MM-AQ-9). However, the emission reduction benefits of these mitigation measures are not readily quantifiable, and thus, mitigated emissions are not presented herein. Further, the magnitude of emission reductions attributable to these mitigation measures is not expected to reduce project emissions attributable to operational activities below ICAPCD's numerical thresholds of significance.

In summary, concurrent construction and operational activities would result in emissions that would exceed the ICAPCD

Health Effects of Criteria Pollutants

Currently, ICAPCD, CARB, and EPA have not approved a quantitative method to reliably, meaningfully, and consistently translate the mass emission estimates for the criteria air pollutants resulting from the project to specific health effects. In addition, there are numerous scientific and technological complexities associated with correlating criteria air pollutant emissions from an individual project to specific health effects or potential additional nonattainment days.

In connection with the judicial proceedings in *Sierra Club v. County of Fresno* (2018) 6 Cal. 5th 502 (Friant Ranch project), SCAQMD and the SJVAPCD filed amicus briefs attesting to the infeasibility of correlating an individual project's criteria air pollutant emissions to specific health impacts. The air quality modeling and health impact evaluation capabilities of both SJVAPCD and SCAQMD are among the most sophisticated of the air districts in California. The key relevant points from the SCAQMD and SJVAPCD briefs are summarized herein.

In requiring a health impact type of analysis for criteria air pollutants, it is important to understand how O_3 and PM are formed, dispersed, and regulated. The formation of O_3 and PM in the atmosphere as secondary pollutants[11] involves complex chemical and physical interactions of multiple pollutants from natural and anthropogenic sources. The O_3 reaction is self-perpetuating (or catalytic) in the presence of sunlight because NO_2 is photochemically reformed from nitric oxide. In this way, O_3 is controlled by both NO_x and VOC emissions (NRC 2005). The complexity of these interacting cycles of pollutants means that incremental decreases in one emission may not result in proportional decreases in O_3 (NRC 2005). Although these reactions and interactions are well-understood, variability in emission source operations and meteorology creates uncertainty in the modeled O_3 concentrations to which downwind populations may be exposed (NRC 2005). Once formed, O_3 can be transported long distances by wind and due to atmospheric transport; contributions of precursors from the surrounding region can also be important (EPA 2008). Because of the complexity of O_3 formation, a specific tonnage amount of VOCs or NO_X emitted in a

[11] Air pollutants formed through chemical reactions in the atmosphere are referred to as secondary pollutants.

particular area does not equate to a particular concentration of O_3 in that area (SJVAPCD 2015). PM can be divided into two categories: directly emitted PM and secondary PM. Secondary PM, like O_3, is formed via complex chemical reactions in the atmosphere between precursor chemicals such as SO_x and NO_x (SJVAPCD 2015). Because of the complexity of secondary PM formation, including the potential to be transported long distances by wind, the tonnage of PM-forming precursor emissions in an area does not necessarily result in an equivalent concentration of secondary PM in that area (SJVAPCD 2015). This is especially true for individual projects, like the project, where project-generated criteria air pollutant emissions are not derived from a single "point source," but from construction equipment and mobile sources (passenger cars and trucks) driving to, from, and around the project sites.

Another important technical nuance is that health effects from air pollutants are related to the concentration of the air pollutant that an individual is exposed to, not necessarily the individual mass quantity of emissions associated with an individual project. For example, health effects from O_3 are correlated with increases in the ambient level of O_3 in the air a person breathes (SCAQMD 2015). However, it takes a large amount of additional precursor emissions to cause a modeled increase in ambient O_3 levels over an entire region (SCAQMD 2015). The lack of a link between the tonnage of precursor pollutants and the concentration of O_3 and $PM_{2.5}$ formed is important because it is not necessarily the tonnage of precursor pollutants that causes human health effects; rather, it is the concentration of resulting O_3 that causes these effects (SJVAPCD 2015). Indeed, the ambient air quality standards, which are statutorily required to be set by EPA at levels that are requisite to protect the public health, are established as concentrations of O_3 and $PM_{2.5}$ and not as tonnages of their precursor pollutants (SJVAPCD 2015). Because the ambient air quality standards are focused on achieving a particular concentration region-wide, the tools and plans for attaining the ambient air quality standards are regional in nature. For CEQA analyses, project-generated emissions are typically estimated in pounds per day or tons per year and compared to mass daily or annual emission thresholds. Although CEQA thresholds are established at levels that the air basin can accommodate without affecting the attainment date for the ambient air quality standards, even if a project exceeds established CEQA significance thresholds, this does not mean that one can easily determine the concentration of O_3 or PM that would be created at or near the project site on a particular day or month of the year, or what specific health impacts would occur (SJVAPCD 2015).

In regard to regional concentrations and air basin attainment, SJVAPCD emphasized that attempting to identify a change in background pollutant concentrations that can be attributed to a single project, even one as large as the entire Friant Ranch Specific Plan,[12] is a theoretical exercise (SJVAPCD 2015). The situation is further complicated by the fact that background concentrations of regional pollutants are not uniform, either temporally or geographically, throughout an air basin but are constantly fluctuating based upon meteorology and other environmental factors. SJVAPCD noted that the currently available modeling tools are equipped to model the impact of all emission sources in the San Joaquin Valley Air Basin on attainment (SJVAPCD 2015). The SJVAPCD brief then indicated that "[r]unning the photochemical grid model used for predicting O_3 attainment with the emissions solely from the Friant Ranch project (which equate to less than one-tenth of one percent of the total NO_x and VOC in the Valley) is not likely to yield valid information given the relative scale involved" (SJVAPCD 2015).

SCAQMD and SJVAPCD have indicated that it is not feasible to quantify project-level health impacts based on existing modeling (SCAQMD 2015; SJVAPCD 2015). Even if a metric could be calculated, it would not be reliable because the models are equipped to model the impact of all emission sources in an air basin on attainment and

[12] The Friant Ranch Specific Plan proposed 2,683 single-family age-restricted units, 83 multifamily age-restricted units, 180 non-age-restricted multifamily units, and 250,000 square feet of commercial village within a Village Core that also provides for up to 50 residential units on approximately 942 acres (County of Fresno 2010).

would likely not yield valid information or a measurable increase in O_3 concentrations sufficient to accurately quantify O_3-related health impacts for an individual project.

Nonetheless, following the Supreme Court's Friant Ranch decision, some environmental impact reports where estimated criteria air pollutant emissions exceeded applicable air district thresholds have included a quantitative analysis of potential project-generated health effects using a combination of a regional photochemical grid model[13] and the EPA Benefits Mapping and Analysis Program (BenMAP or BenMAP–Community Edition).[14] The publicly available health impact assessments (HIAs) typically present results in terms of an increase in health incidences and/or the increase in background health incidence for various health outcomes resulting from the project's estimated increase in concentrations of O_3 and $PM_{2.5}$.[15] To date, the six publicly available HIAs reviewed herein have concluded that the evaluated project's health effects associated with the estimated project-generated increase in concentrations of O_3 and $PM_{2.5}$ represent a small increase in incidences and a very small percent of the number of background incidences, indicating that these health impacts are negligible and potentially within the models' margin of error. It is also important to note that although the results of the six available HIAs conclude that the project emissions do not result in a substantial increase in health incidences, the estimated emissions and assumed toxicity are also conservatively inputted into the HIA and thus overestimate health incidences, particularly for $PM_{2.5}$.

As explained in the SJVAPCD brief and noted previously, running the photochemical grid model used for predicting O_3 attainment with the emissions solely from an individual project like the Friant Ranch project or the project is not likely to yield valid information given the relative scale involved. The six examples reviewed support the SJVAPCD brief's contention that consistent, reliable, and meaningful results may not be provided by methods applied at this time. Accordingly, additional work by the industry and more importantly, air district participation, is needed to develop a more meaningful analysis to correlate project-level mass criteria air pollutant emissions and health effects for decision makers and the public. Furthermore, at the time of writing, no HIA has concluded that health effects estimated using the photochemical grid model and BenMAP approach are substantial provided that the estimated project-generated incidences represent a very small percent of the number of background incidences, potentially within the models' margin of error.

---

13 The first step in the publicly available health impact assessments (HIAs) includes running a regional photochemical grid model, such as the Community Multiscale Air Quality model or the Comprehensive Air Quality Model, with extensions to estimate the increase in concentrations of ozone (O_3) and particulate matter less than or equal to 2.5 microns in diameter ($PM_{2.5}$) as a result of project-generated emissions of criteria and precursor pollutants. Air districts, such as SCAQMD, use photochemical air quality models for regional air quality planning. These photochemical models are large-scale air quality models that simulate the changes of pollutant concentrations in the atmosphere using a set of mathematical equations characterizing the chemical and physical processes in the atmosphere (EPA 2025d).

14 After estimating the increase in concentrations of O_3 and $PM_{2.5}$, the second step in the six examples includes the use of Benefits Mapping and Analysis Program (BenMAP) or BenMAP-Community Edition (BenMAP-CE) to estimate the resulting associated health effects. BenMAP estimates the number of health incidences resulting from changes in air pollution concentrations (EPA 2023). The health impact function in BenMAP-CE incorporates four key sources of data: (1) modeled or monitored air quality changes, (2) population, (3) baseline incidence rates, and (4) an effect estimate. All of the five example HIAs focused on O_3 and $PM_{2.5}$.

15 The following California Environmental Quality Act (CEQA) documents included a quantitative HIA to address Friant Ranch: (1) World Logistics Center Revised Final Environmental Impact Report (EIR) (City of Moreno Valley 2019), (2) March Joint Powers Association K4 Warehouse and Cactus Channel Improvements EIR (March JPA 2019), (3) Mineta San Jose Airport Amendment to the Airport Master Plan EIR (City of San Jose 2019), (4) City of Inglewood Basketball and Entertainment Center Project EIR (City of Inglewood 2020), (5) San Diego State University Mission Valley Campus Master Plan EIR (SDSU 2019), and (6) California State University Dominguez Hills 2018 Campus Master Plan EIR (CSU Dominguez Hills 2019).

Construction of the LVSP would result in emissions that would exceed the ICAPCD and regional thresholds for criteria air pollutants, including VOCs, NO_x, CO, PM_{10}, and $PM_{2.5}$, even after implementation of LVSP measures, regulations, and mitigation.

As discussed in Section 2.1.2, Pollutants and Effects, health effects associated with O_3 include respiratory symptoms, worsening of lung disease leading to premature death, and damage to lung tissue. VOCs and NO_x are precursors to O_3, for which the SSAB is designated as nonattainment with respect to the NAAQS and CAAQS. The contribution of VOCs and NO_x to regional ambient O_3 concentrations is the result of complex photochemistry. The increases in O_3 concentrations in the SSAB due to O_3 precursor emissions tend to be found downwind of the source location because of the time required for the photochemical reactions to occur. Further, the potential for exacerbating excessive O_3 concentrations would also depend on the time of year that the VOC emissions would occur, because exceedances of the O_3 NAAQS and CAAQS tend to occur between April and October, when solar radiation is highest. As described above, due to the lack of quantitative methods to assess this complex photochemistry, the holistic effect of a single project's emissions of O_3 precursors is speculative. That being said, because the project would exceed the ICAPCD VOC and NO_x thresholds during project operation, the project could contribute to health effects associated with O_3.

Health effects associated with NO_x and NO_2 (which is a constituent of NO_x) include lung irritation and enhanced allergic responses (see Section 2.1.2). Although project-related NO_x emissions would exceed the ICAPCD operational mass daily thresholds, because the SSAB is a designated attainment area for NO_2 (and NO_2 is a constituent of NO_x) and the existing NO_2 concentrations in the area are well below the NAAQS and CAAQS standards,[16] it is not anticipated that the LVSP would cause an exceedance of the NAAQS and CAAQS for NO_2 or result in potential health effects associated with NO_2 and NO_x. However, because the LVSP would exceed the ICAPCD NO_x threshold during operation, the LVSP could contribute to health effects associated with NO_x and NO_2.

Health effects associated with CO include chest pain in patients with heart disease, headache, light-headedness, and reduced mental alertness (see Section 2.1.2). CO tends to be a localized impact associated with congested intersections. The potential for CO hotspots is discussed under Section 2.4.3 below and is determined to be less than significant. Thus, the LVSP's CO emissions would not contribute to significant health effects associated with CO.

Health effects associated with PM_{10} and $PM_{2.5}$ include premature death and hospitalization, primarily for worsening of respiratory disease (see Section 2.1.2). Operation of the LVSP would exceed the ICAPCD thresholds for PM_{10} and $PM_{2.5}$. As such, the LVSP would potentially contribute to exceedances of the NAAQS and CAAQS for PM and obstruct the SSAB from coming into attainment for these pollutants. Regarding playa dust, as discussed in Section 2.1.2.2, Noncriteria Air Pollutants, current research does not support the idea that playa dust (dust PM_{10}) is exceptionally high in toxic metals (IID 2024) and therefore would not result in additional health effects beyond those associated with other PM. Because the LVSP has the potential to contribute substantial PM during operation, the LVSP could result in associated health effects. To combat potential health concerns, development within the LVSP would minimize the generation of airborne playa dust in several ways. Construction would include dust control measures, as described in Policy HP-18, Dust Suppression, and ICAPCD Regulation VIII Rules 800–806. Additionally, the LVSP would require that all roads used by future development projects within the Plan Area would need to be paved, per Policy HP-19, Paved Roads. The paving of previously unpaved roads and the construction of new paved roads would reduce the amount of PM_{10} generated within the Plan Area. By implementing dust-suppressing strategies during

[16] See Table 2-2, which shows that ambient concentrations of nitrogen dioxide (NO_2) at the El Centro monitoring station did not exceed the National Ambient Air Quality Standards or California Ambient Air Quality Standards between 2021 and 2023.

construction and a portion of long-term operations and also paving roadways, the LVSP would effectively reduce the generation of PM_{10} and minimize its risk of exposure on the project.

Although the above scientific and technological constraints present considerable doubt that quantifying health effects for individual CEQA projects may not accurately and meaningfully inform the public of how project-generated bare numbers (i.e., estimated criteria air pollutant emissions) translate to create potential adverse health effects, due to the size and scale of the LVSP, additional analysis is presented below for emissions occurring within the County.

The EPA CO-Benefits Risk Assessment (COBRA) screening model was used to estimate the potential health effects of the project based on the emissions of air pollutants (EPA 2021). The analysis year of 2055 was selected because it is the project's buildout year. The State of California and the County were selected for the location. For the statewide run, California was selected as the geographical extent. The criteria air pollutant emissions estimated using the methodologies above (see the Operational Emission Source Assumptions subsection and Impact AQ-2) were assumed for each location. A discount rate of 2% was selected because it is the default. COBRA assumes changes in adult mortality and nonfatal heart attacks occur over a 20-year period.

For Imperial County,[17] health outcomes related to O_3 and $PM_{2.5}$ attributed to project-related increases in ambient air concentrations include asthma-related emergency room visits (0.003 incidences per year), lung cancer incidence (0.2 incidences per year), all cardiovascular-related hospital admissions (not including myocardial infarctions) (0.96 incidences per year), all respiratory-related hospital admissions (0.5 incidences per year), mortality (2.3–5.1 incidences per year), and nonfatal acute myocardial infarction (1.6 incidences per year for all age groups). For context, between 2020 and 2022, the California Department of Public Health reported that Imperial County had an annual average of 1,653 mortalities from all causes and an age-adjusted death rate of 790 mortalities per 100,000 population (CDPH 2024b).

There are numerous scientific and technological complexities associated with correlating criteria air pollutant emissions from an individual project to specific health effects or potential additional nonattainment days, and methods available to quantitatively evaluate health effects may not be appropriate to apply to emissions associated with the project, which cannot be estimated with accuracy. See Appendix C, Health Effects of Criteria Air Pollutants Memorandum, for a detailed discussion of the health effects of criteria air pollutant emissions.

Summary

Criteria air pollutant emissions from project construction, project operation, and periods of overlapping construction and operation would be significant and unavoidable after mitigation. Associated health impacts related to criteria pollutants would also be **significant and unavoidable**.

Level of Significance Before Mitigation

Project-generated criteria air pollutant emissions during construction and operation would be **significant**.

[17] The CO-Benefits Risk Assessment inputs for mitigated annual criteria air pollutant emissions within San Joaquin County include the following (totals from multiple tables provided herein): 288.17 per year volatile organic compounds, 370.29 tons per year oxides of nitrogen, 1.96 tons per year sulfur dioxide, and 243.31 tons per year $PM_{2.5}$.

Mitigation Measures

MM-AQ-1 Additional Construction Equipment Emission Reductions. Prior to the issuance of grading permits, an individual project applicant or its designee shall provide evidence to the County of Imperial (County) that the following strategies shall be implemented during the project's construction phase:

A. Use electric- or hybrid-powered equipment for generators and other small pieces of equipment over 25 horsepower (e.g., forklifts), as commercially available.
B. Use cleaner fuel equipment, such as replacing diesel fuel with compressed natural gas or renewable diesel, as commercially available.

Commercially available equipment is herein defined as equipment sourced within 50 vehicle miles of the project site and within 10% of the cost of the diesel-fueled-equivalent equipment. The individual project applicant must contact at least three contractors or vendors within the County and submit to the County justification if the specified equipment is not commercially available.

MM-AQ-2 Notification of Construction Activities. Prior to the commencement of any construction activities, the applicant or its designee shall provide evidence to the County of Imperial that the applicant has employed a construction relations officer who will address community concerns regarding on-site construction activity. The applicant shall provide public notification in the form of a visible sign containing the contact information of the construction relations officer, who shall document complaints and concerns regarding on-site construction activity. The sign shall be placed in easily accessible locations and noted on grading and improvement plans.

MM-AQ-3 Limit Truck and Equipment Idling During Construction. The project applicant shall reduce idling time of heavy-duty trucks, either by requiring them to be shut off when not in use or limiting the time of idling to no more than 3 minutes (thereby improving upon the 5-minute idling limit required by the State Airborne Toxics Control Measure to Limit Diesel-Fueled commercial Motor Vehicle Idling, 13 CCR 2485). The project applicant shall post clear signage reminding construction workers to limit idling of construction equipment.

MM-AQ-4 Use of Super-Compliant Low-VOC Paint During Construction. During construction, the project shall use super-compliant low-VOC (volatile organic compound) paint (less than 10 grams per liter VOC) for all interior and exterior paint applications for residential and nonresidential land uses.

MM-AQ-5 Low-VOC Cleaning Supplies and Paint Educational Program. Prior to the occupancy of any on-site development, the applicant or its designee shall provide evidence to the County of Imperial that the applicant/phase developer has developed a green cleaning product and paint education program, to be made available at rental and purchasing offices and/or on websites. The educational program shall include a flyer (hardcopy and/or digital) that includes, at a minimum, an explanation of what volatile organic compounds (VOCs) are, how VOCs affect us, where to find low-VOC alternatives for cleaning supplies and paint, and additional resources for learning more.

MM-AQ-6 Landscape Maintenance Equipment Emission Reduction. The project applicant shall implement the following landscape maintenance equipment emission reduction measures:

a. **Include Outdoor Electrical Outlets.** Prior to the issuance of building permits, the project applicant or its designee shall provide evidence to the County of Imperial that the design plans include electrical outlets on structure exteriors to facilitate the use of electrical lawn and garden equipment.

b. **Encourage Use of Existing Yard Equipment Exchange and Rebate Programs.** Educational materials shall be provided to future residents about the Imperial County Air Pollution Control District Electric Lawn Mower Rebate Program and the Commercial Lawn Equipment Exchange Program. When conventional gasoline-powered yard equipment (e.g., lawn mowers, leaf blowers and vacuums, shredders, trimmers, and chainsaws) is exchanged for electric and rechargeable battery-powered yard equipment, direct greenhouse gas (GHG) emissions from fossil fuel combustion are displaced by indirect GHG emissions associated with the generation of electricity used to power the equipment.

MM-AQ-7 Idling Time Restriction. The following measure shall be implemented during all ongoing business operations and shall be included as part of contractual lease agreement language to ensure that tenants and operators of future development projects are informed of the following operational responsibility: Upon commencement of operations, the tenant/operator of future development projects shall be required to restrict truck idling on site to a maximum of 3 minutes, subject to exceptions defined by the California Air Resources Board's commercial vehicle idling requirements. The building manager or their designee shall be responsible for enforcing this requirement.

MM-AQ-8 Anti-Idling Implementation Measures. The following measures shall be implemented to reduce air pollutant emissions from idling during operations:

A. **Signage.** Legible, durable, weatherproof signs that identify the project's 3-minute idling restriction shall be placed at truck access gates, loading docks, and truck parking areas. At a minimum, each sign shall include: (1) instructions for truck drivers to shut off engines when not in use; (2) instructions for drivers of diesel trucks to restrict idling to no more than 3 minutes once the vehicle is stopped, the transmission is set to "neutral" or "park," and the parking brake is engaged; (3) telephone numbers of the building facilities manager and California Air Resources Board (CARB) to report violations; and (4) that penalties apply for violations. Prior to the issuance of an occupancy permit, the County of Imperial shall conduct a site inspection to ensure that the signs are in place.

B. **Efficient Load Management. The** facility operator(s) shall be required to train managers and employees on efficient scheduling and load management to eliminate unnecessary queuing and idling of trucks.

C. **Anti-Idling Training. Anti-Idling Training.** Tenants and operators at each project site shall ensure that site enforcement staff in charge of keeping the daily log and monitoring for excess idling will be trained/certified in diesel health effects and technologies, for example, by requiring attendance at CARB-approved courses (such as the free 1-day Course No. 512).

MM-AQ-9 Operational Backup Generator Emission Reductions. Prior to the issuance of building permits, an individual project applicant or its designee shall provide evidence to the County of Imperial (County) that any backup generators greater than 500 horsepower shall meet the U.S. Environmental Protection Agency's Tier 4 Final emission standards, to the extent feasible. If Tier 4

Final equipment is not available for a specific application, the project applicant shall provide documentation to the County demonstrating the unavailability and shall use the next-cleanest available technology, such as Tier 4 Interim or Tier 3 engines equipped with verified diesel emission control strategies, such as diesel particulate filters.

MM-AQ-10 Valley Fever Exposure Minimization. Prior to any ground-disturbing activities within Imperial County, the County of Imperial (County) or its designees shall implement the following valley fever provisions:

A. Between June 1 and November 30, when valley fever rates of infection are the highest, if wind speeds exceed 15 mph or temperatures exceed 95°F for 3 consecutive days, additional dust suppression measures (such as additional water or the application of additional soil stabilizer) shall be implemented prior to and immediately following ground-disturbing activities. The additional dust suppression shall continue until winds are 10 mph or lower and outdoor air temperatures are below 90°F for at least 2 consecutive days. The additional dust suppression measures shall be incorporated into the dust control plan.

B. Prior to any project forest treatment activity, the County shall prepare and implement a worker training program that describes potential health hazards associated with valley fever, common symptoms, proper safety procedures to minimize health hazards, and notification procedures if suspected work-related symptoms are identified during operation. The worker training program shall identify safety measures to be implemented by the County or its contractor during operation. Safety measures shall include the following:

- Provide HEPA-filtered air-conditioned enclosed cabs on heavy equipment. Train workers on the proper use of cabs, such as turning on air conditioning prior to using the equipment.
- Provide communication methods, such as two-way radios, for use by workers in enclosed cabs.
- Provide personal protective equipment, such as half-mask and/or full-mask respirators equipped with particulate filtration, to workers active in dusty work areas.
- Provide separate, clean eating areas with handwashing facilities for workers.
- Clean equipment, vehicles, and other items before they are moved off site to other work locations.

MM-AQ-11 Odor Control and Abatement Program – Anaerobic Digester Facilities and Wastewater Treatment Plants. Prior to issuing any building permits for odor-emitting facilities, the County of Imperial (County) or its designees shall implement the following odor control measures:

A. Odor Treatment Systems:

- The County shall require the facility to install and maintain effective odor control technologies, such as biofilters, activated carbon filters, or scrubber systems, to capture and neutralize odorous gases at their source.
- The County shall ensure that the facility conducts regular monitoring and maintenance to verify the performance of these odor control systems.

B. Regular Monitoring and Reporting:
   - The County shall mandate that the facility conduct regular odor monitoring at key locations around the site and at sensitive-receptor points (e.g., residential areas.
   - The County shall require the facility to submit periodic reports to ensure compliance with odor control standards and to evaluate the effectiveness of implemented measures.

C. Buffer Zones and Site Design:
   - The County shall ensure that an adequate buffer zone is maintained around odor-emitting facilities, including anaerobic digesters and wastewater treatment areas, to minimize exposure to sensitive receptors.
   - The County shall review and approve the facility's site design, ensuring that prevailing wind patterns and the distance to sensitive areas are considered, in order to reduce odor impacts.

Level of Significance After Mitigation

Construction of Phase 1, Phase 2, and Phase 3 of the project would exceed the criteria pollutant thresholds for VOCs, NO_x, CO, PM_{10}, and $PM_{2.5}$ established by ICAPCD with implementation of LVSP measures and regulations, resulting in a **significant** impact prior to mitigation. MM-AQ-1 through MM-AQ-5 would be implemented to reduce the project's criteria air pollutant emissions during construction but were not quantified. Therefore, construction-related impacts associated with a cumulatively considerable net increase of any criteria pollutant for which the project region is nonattainment would be **significant and unavoidable**.

During operation of two interim phases and buildout, the project would exceed the numerical thresholds of significance established by ICAPCD for emissions of VOCs, NO_x, CO, PM_{10}, and $PM_{2.5}$ with implementation of LVSP measures, resulting in a **significant** impact prior to mitigation. MM-AQ-5 through MM-AQ-9 and MM-TRA-1 through MM-TRA-4 would be implemented to reduce the project's criteria air pollutant emissions during operation but were not quantified. Therefore, the project would result in a cumulatively considerable increase in emissions of nonattainment pollutants, and the impact would be **significant and unavoidable**.

Concurrent construction and operational activities would also exceed the numerical thresholds of significance recommended by ICAPCD for operational emissions of VOCs, NO_x, CO, PM_{10}, and $PM_{2.5}$.

2.4.3 Would the project expose sensitive receptors to substantial pollutant concentrations?

Health Effects of Carbon Monoxide (Potential for Carbon Monoxide Hotspots)

Mobile source impacts occur on two scales. Regionally, LVSP-related travel would add to regional trip generation and increase the VMT within the local airshed and the SSAB. Locally, traffic generated by the LVSP would be added to the local roadway system near the project site. If such traffic occurs during periods of poor atmospheric ventilation, is composed of many vehicles cold-started and operating at pollution-inefficient speeds, and is operating on roadways already crowded with non-project traffic, there is a potential for the formation of microscale CO hotspots in the area immediately around points of congested traffic. Because of continued improvement in

vehicular emissions at a rate faster than the rate of vehicle growth and/or congestion, the potential for CO hotspots in the SSAB is steadily decreasing.

At the time that the SCAQMD Handbook (1993) was published, the SCAB was designated nonattainment under the CAAQS and NAAQS for CO. In 2007, the SCAB was designated attainment for CO under both the CAAQS and NAAQS as a result of the steady decline in CO concentrations in the SCAB due to the turnover of older vehicles, introduction of cleaner fuels, and implementation of control technology on industrial facilities. SCAQMD conducted CO modeling for the 2003 AQMP[18] (SCAQMD 2003) for the four worst-case intersections in the SCAB: (1) Wilshire Boulevard and Veteran Avenue, (2) Sunset Boulevard and Highland Avenue, (3) La Cienega Boulevard and Century Boulevard, and (4) Long Beach Boulevard and Imperial Highway. At the time the 2003 AQMP was prepared, the intersection of Wilshire Boulevard and Veteran Avenue was the most congested intersection in Los Angeles County, with an average daily traffic volume of about 100,000 vehicles per day (SCAQMD 2003). Using CO emission factors for 2002, the peak modeled CO 1-hour concentration was estimated to be 4.6 ppm at the intersection of Wilshire Boulevard and Veteran Avenue. When added to the maximum 1-hour CO concentration from 2022 through 2024 at the Calexico High School monitoring station (see Table 2-2, Local Ambient Air Quality Data), which was 5.0 ppm in 2022, the 1-hour CO concentration would be 9.6 ppm, whereas the CAAQS is 20 ppm.

The 2003 AQMP also projected 8-hour CO concentrations at these four intersections for 1997 and from 2002 through 2005. From years 2002 through 2005, the maximum 8-hour CO concentration was 3.8 ppm at the Sunset Boulevard and Highland Avenue intersection in 2002; the maximum 8-hour CO concentration was 3.4 ppm at the Wilshire Boulevard and Veteran Avenue in 2002. Adding the 3.8 ppm to the maximum 8-hour CO concentration from 2022 through 2024 at the Calexico High School monitoring station (see Table 2-2), which was 3.6 ppm in 2022, the 8-hour CO would be 7.4 ppm, whereas the CAAQS is 9.0 ppm. Accordingly, CO concentrations at congested intersections would not exceed the 1-hour or 8-hour CO CAAQS unless projected daily traffic would be over 100,000 vehicles per day (e.g., intersections exceeding 100,000 vehicles per day do not necessarily result in a CO hotspot but instead may require additional analysis per the methodology applied herein).

The traffic analysis prepared for the LVSP evaluated average daily trips at 38 intersections within the Plan Area. Under 2050 conditions with full buildout of Phase 3 of the LVSP, the maximum daily intersection volume was estimated to be 49,990 trips, which occurs at the SR-111/SR-98 intersection (RICK Engineering 2025). See Appendix D, Carbon Monoxide Hotspots Intersection Volume Calculations, for details.

Regarding potential CO hotspots during construction, the maximum daily trips during construction are estimated to be 11,670 daily trips (during Phase 1 construction), which would be substantially less than LVSP operational trip generation. Phase 1, Phase 2, and Phase 3 (Buildout) are estimated to generate a total of 47,055 trips per day, 80,243 trips per day, and 92,933 trips per day, respectively. In addition, the overlap of Phase 3 construction (3,902 daily trips) and Phase 2 (including Phase 1) operation would generate a total of 84,145 trips per day. Thus, the maximum daily intersection volume with the addition of these vehicles on the roadway network during construction would be less than during operation.

Because the project would not contribute vehicles to any study intersection that would experience more than 100,000 vehicles per day during construction or operation, a CO hotspot is not anticipated to occur, and associated

[18] SCAQMD's carbon monoxide hotspot modeling guidance has not changed since 2003.

impacts would be less than significant. As such, potential project-generated impacts associated with CO hotspots during construction and operation would be **less than significant** without mitigation.

Toxic Air Contaminants

As discussed in Section 2.3.2.3, Health Risk Assessment, an HRA was performed to estimate the Maximum Individual Cancer Risk and the chronic hazard index for proximate residential receptors because of project construction and operation. Results of the HRA under unmitigated conditions are presented in Table 2-26.

Table 2-26. Health Risk Assessment Results

Impact Parameter	UTME (m)	UTMN (m)	Units	Project Impact	CEQA Threshold	Level of Significance
Maximum Individual Cancer Risk – Residential Off Site	636713.34	3666773.01	per million	24.4	10	**Significant**
Chronic Hazard Index – Residential Off Site	636713.34	3666773.01	index value	0.2	1.0	**Less than Significant**
Acute Hazard Index – Residential Off Site	636713.34	3666773.01	index value	0.2	1.0	**Less than Significant**
Maximum Individual Cancer Risk – Residential On Site	637181.16	3668546.19	per million	37.3	10	**Significant**
Chronic Hazard Index – Residential On Site	637181.16	3668546.19	index value	0.6	1.0	**Less than Significant**
Acute Hazard Index – Residential On Site	637194.73	3666999.56	index value	0.4	1.0	**Less than Significant**
Maximum Individual Cancer Risk – Worker On Site	637181.16	3668546.19	per million	49.8	10	**Significant**
Chronic Hazard Index – Worker On Site	637181.16	3668546.19	index value	0.9	1.0	**Less than Significant**
Acute Hazard Index – Worker On Site	637194.73	3666999.56	index value	0.4	1.0	**Less than Significant**

Note: UTME = Universal Transverse Mercator East; m = meter; UTMN = Universal Transverse Mercator North; CEQA = California Environmental Quality Act.
See Appendix E, Health Risk Assessment.

As shown in Table 2-26, project activities would result in a Residential Maximum Individual Cancer Risk of 24.4 in 1 million for off-site receptors, 37.3 in 1 million for on-site receptors, and 49.8 in 1 million for worker receptors, which exceeds the significance threshold of 10 in 1 million. The project would result in a chronic hazard index of 0.2 for off-site receptors, 0.6 for on-site receptors, and 0.9 for worker receptors, which is below the 1.0 significance threshold. The project would result in an acute hazard index of 0.2 for off-site receptors, 0.4 for on-site receptors, and 0.4 for worker receptors, which is below the 1.0 significance threshold. The project's TAC health risk impacts related to residential off-site cancer risk, residential on-site cancer risk, and worker on-site cancer risk would be **significant prior to mitigation**.

MM-AQ-1 through MM-AQ-9 would be implemented to reduce the project's TAC emissions during construction and operation but were not able to be quantified. Therefore, impacts associated with exposing sensitive receptors to substantial TAC concentrations would be **significant and unavoidable** related to residential off-site cancer risk, residential on-site cancer risk, residential off-site acute hazard index, and worker on-site cancer risk.

Valley Fever

As discussed in Section 2.1.2.2, Noncriteria Air Pollutants, valley fever is not highly endemic to Imperial County, with an incident rate of 11.7 cases per 100,000 people in 2023 (CDPH 2024a).

Propagation of valley fever is dependent on climatic conditions, with the potential for growth and surface exposure highest following early seasonal rains and long dry spells. Valley fever spores can be released when filaments are disturbed by earth-moving activities, although receptors must be exposed to and inhale the spores to be at increased risk of developing valley fever. Moreover, exposure to valley fever does not guarantee that an individual will become ill—approximately 60% of people exposed to the fungal spores are asymptomatic and show no signs of an infection (USGS 2000).

Development within the LVSP would employ dust control measures in accordance with the rules under ICAPCD Regulation VIII, Fugitive Dust Control Measures, which limit the amount of fugitive dust generated during construction. Furthermore, the implementation of Policy HP-18, Dust Suppression, would go beyond the requirements of ICAPCD Regulation VIII and would be implemented to further reduce fugitive dust generated by the LVSP during construction. These requirements are consistent with California Department of Public Health recommendations for the implementation of dust control measures, including regular application of water during soil-disturbing activities, to reduce exposure to valley fever by minimizing the potential that the fungal spores become airborne (CDPH 2013). Further, regulations designed to minimize exposure to valley fever hazards are included in Title 8 of the California Code of Regulations and would be complied with during the project's construction phase (California Department of Industrial Relations 2017).

Despite the LVSP's compliance with applicable regulatory standards and implementation of additional dust control measures, including Policy HP-18, as shown in Table 2-20, the magnitude of fugitive dust emissions (PM_{10}) during construction is substantial, and the potential for valley fever impacts is therefore **significant prior to mitigation**. The project would implement MM-AQ-10, Valley Fever Exposure Minimization, during construction, which would require additional dust suppression when valley fever rates of infection are the highest, in addition to a worker training program. Impacts associated with valley fever exposure for sensitive receptors during construction would be **less than significant with mitigation**.

During operation, the LVSP would require that all roads used by future development projects within the Plan Area would need to be paved, per Policy HP-19, Paved Roads, which would limit the amount of fugitive dust generated from vehicle travel. Operational activities would not involve substantial earth-moving activities, and valley fever spores would therefore have little potential to be released. As such, impacts associated with valley fever exposure for sensitive receptors during operation would be **less than significant**.

Summary

The potential for CO hotspots during operation would be less than significant without mitigation. Localized criteria air pollutant emissions and potential cancer health risks during construction and operation would be **significant and unavoidable** after mitigation. The potential for valley fever exposure during construction would be **less than significant with mitigation** and **less than significant** during operation without mitigation.

Level of Significance Before Mitigation

The potential for CO hotspots during operation would be less than significant without mitigation. Localized criteria air pollutant emissions and potential cancer health risks during construction and operation would be **significant** before mitigation. The potential for valley fever exposure during construction would be **significant** before mitigation.

Mitigation Measures

MM-AQ-10 Valley Fever Exposure Minimization. Prior to any ground-disturbing activities within Imperial County, the County of Imperial (County) or its designees shall implement the following valley fever provisions:

A. Between June 1 and November 30, when valley fever rates of infection are the highest, if wind speeds exceed 15 mph or temperatures exceed 95°F for 3 consecutive days, additional dust suppression measures (such as additional water or the application of additional soil stabilizer) shall be implemented prior to and immediately following ground-disturbing activities. The additional dust suppression shall continue until winds are 10 mph or lower and outdoor air temperatures are below 90°F for at least 2 consecutive days. The additional dust suppression measures shall be incorporated into the dust control plan.

B. Prior to any project forest treatment activity, the County shall prepare and implement a worker training program that describes potential health hazards associated with valley fever, common symptoms, proper safety procedures to minimize health hazards, and notification procedures if suspected work-related symptoms are identified during operation. The worker training program shall identify safety measures to be implemented by the County or its contractor during operation. Safety measures shall include the following:

- Provide HEPA-filtered air-conditioned enclosed cabs on heavy equipment. Train workers on the proper use of cabs, such as turning on air conditioning prior to using the equipment.
- Provide communication methods, such as two-way radios, for use by workers in enclosed cabs.
- Provide personal protective equipment, such as half-mask and/or full-mask respirators equipped with particulate filtration, to workers active in dusty work areas.
- Provide separate, clean eating areas with handwashing facilities for workers.
- Clean equipment, vehicles, and other items before they are moved off site to other work locations.

Level of Significance After Mitigation

The potential for CO hotspots during operation would be **less than significant** without mitigation. Localized criteria air pollutant emissions and potential cancer health risks during construction and operation would be **significant and unavoidable** after mitigation. The potential for valley fever exposure during construction would be **less than significant with mitigation** and **less than significant** during operation without mitigation.

2.4.4 Would the project result in other emissions (such as those leading to odors) adversely affecting a substantial number of people?

Construction and operation of the LVSP would result in various emissions; however, criteria air pollutants, fugitive dust, and TACs are addressed under Sections 2.4.2 and 2.4.3, above. As such, this impact analysis is focused on the potential for an odor impact to occur. The occurrence and severity of potential odor impacts depends on numerous factors. The nature, frequency, and intensity of the source; the wind speeds and direction; and the sensitivity of receiving location each contribute to the intensity of the impact. Although offensive odors seldom cause physical harm, they can be annoying, cause distress among the public, and generate citizen complaints.

Odors would also be generated from vehicles and/or equipment exhaust emissions during construction of the LVSP. Odors produced during construction would be attributable to concentrations of unburned hydrocarbons from the tailpipes of construction equipment, architectural coatings, and asphalt pavement application. Such odors would be temporary and intermittent, would not affect a substantial number of people, and are typically expected by most individuals at the construction site. Such odors would also disperse rapidly from the Plan Area and generally occur at magnitudes that would not affect substantial numbers of people. Therefore, impacts associated with odors during construction would be considered **less than significant.**

Land uses and industrial operations associated with odor complaints include agricultural uses, wastewater treatment plants, food processing plants, chemical plants, composting, refineries, landfills, dairies, and fiberglass molding (SCAQMD 1993). Most of the land uses proposed by the LVSP would not engage in any of these activities or other potential activities that would generate operational odors. The LVSP entails operation of Solar, Community Opportunity Areas, Playas Renewables, Green Industrial, Manufacturing, and Logistics land use designations.

However, wastewater treatment plant and anaerobic digester facilities are proposed as land uses to be developed under the LVSP. As described in the LVSP, although these facilities are required to have advanced odor management systems (e.g., biofilters or carbon scrubbers) to control and minimize off-site odor impacts, they still have the potential to create new sources of odors during operation and could potentially create an odor nuisance pursuant to ICAPCD Rule 407, Nuisances. Therefore, operation of the project would result in odor impacts that are **significant.**

The project would implement MM-AQ-11, Odor Control and Abatement Program – Anaerobic Digester Facilities and Wastewater Treatment Plants, which would require these facilities to install odor treatment systems, implement regular monitoring and reporting, and ensure there are adequate buffer zones around the facilities. As such, the project would result in odor impacts during operations that are **less than significant with mitigation**.

Level of Significance Before Mitigation

Impacts would be **significant**.

Mitigation Measures

MM-AQ-11 Odor Control and Abatement Program – Anaerobic Digester Facilities and Wastewater Treatment Plants. Prior to issuing any building permits for odor-emitting facilities, the County of Imperial (County) or its designees shall implement the following odor control measures:

A. Odor Treatment Systems:
   - The County shall require the facility to install and maintain effective odor control technologies, such as biofilters, activated carbon filters, or scrubber systems, to capture and neutralize odorous gases at their source.
   - The County shall ensure that the facility conducts regular monitoring and maintenance to verify the performance of these odor control systems.

B. Regular Monitoring and Reporting:
   - The County shall mandate that the facility conduct regular odor monitoring at key locations around the site and at sensitive-receptor points (e.g., residential areas).
   - The County shall require the facility to submit periodic reports to ensure compliance with odor control standards and to evaluate the effectiveness of implemented measures.

C. Buffer Zones and Site Design:
   - The County shall ensure that an adequate buffer zone is maintained around odor-emitting facilities, including anaerobic digesters and wastewater treatment areas, to minimize exposure to sensitive receptors.
   - The County shall review and approve the facility's site design, ensuring that prevailing wind patterns and the distance to sensitive areas are considered, in order to reduce odor impacts.

Level of Significance After Mitigation

Impacts would be **less than significant with mitigation**.

3 Greenhouse Gas Emissions

3.1 Environmental Setting

3.1.1 Climate Change Overview

Climate change refers to any significant change in measures of climate, such as temperature, precipitation, or wind patterns, lasting for an extended period of time (i.e., decades or longer). The Earth's temperature depends on the balance between energy entering and leaving the planet's system. Many factors, both natural and human, can cause changes in Earth's energy balance, including variations in the sun's energy reaching Earth, changes in the reflectivity of Earth's atmosphere and surface, and changes in the greenhouse effect, which affects the amount of heat retained by Earth's atmosphere (EPA 2025e).

The greenhouse effect is the trapping and buildup of heat in the atmosphere (troposphere) near the Earth's surface. The greenhouse effect traps heat in the troposphere through a threefold process, as follows: Short-wave radiation emitted by the sun is absorbed by the Earth, the Earth emits a portion of this energy in the form of long-wave radiation, and GHGs in the upper atmosphere absorb this long-wave radiation and emit it into space and toward the Earth. The greenhouse effect is a natural process that contributes to regulating the Earth's temperature and creates a pleasant, livable environment on the Earth. Human activities that emit additional GHGs to the atmosphere increase the amount of infrared radiation that gets absorbed before escaping into space, thus enhancing the greenhouse effect and causing the Earth's surface temperature to rise (EPA 2025e).

The scientific record of the Earth's climate shows that the climate system varies naturally over a wide range of time scales, and that, in general, climate changes prior to the Industrial Revolution in the 1700s can be explained by natural causes, such as changes in solar energy, volcanic eruptions, and natural changes in GHG concentrations. However, recent climate changes, in particular the warming observed over the past century, cannot be explained by natural causes alone. Rather, it is extremely likely that human activities have been the dominant cause of that warming since the mid-twentieth century and are the most significant driver of observed climate change (IPCC 2013; EPA 2025f). Human influence on the climate system is evident from the increasing GHG concentrations in the atmosphere, positive radiative forcing, observed warming, and improved understanding of the climate system (IPCC 2013). The atmospheric concentrations of GHGs have increased to levels unprecedented in the last 800,000 years, primarily from fossil fuel emissions and secondarily from emissions associated with land use changes (IPCC 2013). Continued emissions of GHGs will cause further warming and changes in all components of the climate system, which is discussed further in Section 3.2.5, Potential Effects of Climate Change.

3.1.2 Greenhouse Gases

A GHG is any gas that absorbs infrared radiation in the atmosphere; in other words, GHGs trap heat in the atmosphere. As defined in California Health and Safety Code Section 38505(g), for purposes of administering many of the state's primary GHG emissions reduction programs, GHGs include carbon dioxide (CO_2), methane (CH_4), nitrous oxide (N_2O), hydrofluorocarbons (HFCs), perfluorocarbons (PFCs), sulfur hexafluoride (SF_6), and nitrogen trifluoride (see also CEQA Guidelines Section 15364.5). Some GHGs, such as CO_2, CH_4, and N_2O, occur naturally and are emitted into the atmosphere through natural processes and human activities. Of these gases, CO_2 and CH_4 are emitted in the greatest quantities from human activities. Manufactured GHGs, which have a much greater heat-absorption potential than CO_2, include fluorinated gases, such as HFCs, PFCs, and SF_6, which are associated with

certain industrial products and processes. The following paragraphs provide a summary of the most common GHGs and their sources.[19]

Carbon Dioxide. CO_2 is a naturally occurring gas and a byproduct of human activities and is the principal anthropogenic GHG that affects the Earth's radiative balance. Natural sources of CO_2 include respiration of bacteria, plants, animals, and fungus; evaporation from oceans; volcanic out-gassing; and decomposition of dead organic matter. Human activities that generate CO_2 include combustion of fuels such as coal, oil, natural gas, and wood and changes in land use.

Methane. CH_4 is produced through both natural and human activities. CH_4 is a flammable gas and is the main component of natural gas. CH_4 is produced through anaerobic (without oxygen) decomposition of waste in landfills, flooded rice fields, animal digestion, decomposition of animal wastes, production and distribution of natural gas and petroleum, coal production, and incomplete fossil fuel combustion.

Nitrous Oxide. N_2O is produced through natural and human activities, mainly through agricultural activities and natural biological processes, although fuel burning and other processes also create N_2O. Sources of N_2O include soil cultivation practices (microbial processes in soil and water), especially the use of commercial and organic fertilizers, manure management, industrial processes (such as in nitric acid production, nylon production, and fossil-fuel-fired power plants), vehicle emissions, and using N_2O as a propellant (e.g., rockets, racecars, and aerosol sprays).

Fluorinated Gases. Fluorinated gases (also referred to as F-gases) are synthetic powerful GHGs emitted from many industrial processes. Fluorinated gases are commonly used as substitutes for stratospheric O_3-depleting substances (e.g., chlorofluorocarbons [CFCs], hydrochlorofluorocarbons [HCFCs], and halons). The most prevalent fluorinated gases include the following:

- **Hydrofluorocarbons:** HFCs are compounds containing only hydrogen, fluorine, and carbon atoms. HFCs are synthetic chemicals used as alternatives to O_3-depleting substances in serving many industrial, commercial, and personal needs. HFCs are emitted as by-products of industrial processes and are used in manufacturing.
- **Perfluorocarbons:** PFCs are a group of human-made chemicals composed of carbon and fluorine only. These chemicals were introduced as alternatives, with HFCs, to the O_3-depleting substances. The two main sources of PFCs are primary aluminum production and semiconductor manufacturing. Because PFCs have stable molecular structures and do not break down through the chemical processes in the lower atmosphere, these chemicals have long lifetimes, ranging between 10,000 and 50,000 years.
- **Sulfur Hexafluoride:** SF_6 is a colorless gas soluble in alcohol and ether and slightly soluble in water. SF_6 is used for insulation in electric power transmission and distribution equipment, semiconductor manufacturing, the magnesium industry, and as a tracer gas for leak detection.
- **Nitrogen Trifluoride:** Nitrogen trifluoride is used in the manufacture of a variety of electronics, including semiconductors and flat panel displays.

[19] The descriptions of greenhouse gases (GHGs) are summarized from the Intergovernmental Panel on Climate Change Fourth Assessment Report (IPCC 2007), the CARB GHG Inventory Glossary (CARB 2025l), and the EPA Glossary of Climate Change Terms (EPA 2017).

Chlorofluorocarbons. CFCs are synthetic chemicals that have been used as cleaning solvents, refrigerants, and aerosol propellants. CFCs are chemically unreactive in the lower atmosphere (troposphere), and the production of CFCs was prohibited in 1987 due to the chemical destruction of stratospheric O_3.

Hydrochlorofluorocarbons. HCFCs are a large group of compounds whose structure is very close to that of CFCs—containing hydrogen, fluorine, chlorine, and carbon atoms—but including one or more hydrogen atoms. Like HFCs, HCFCs are used in refrigerants and propellants. HCFCs were also used in place of CFCs for some applications; however, their use in general is being phased out.

Black Carbon. Black carbon is a component of $PM_{2.5}$, which has been identified as a leading environmental risk factor for premature death. It is produced from the incomplete combustion of fossil fuels and biomass burning, particularly from older diesel engines and forest fires. Black carbon warms the atmosphere by absorbing solar radiation, influences cloud formation, and darkens the surface of snow and ice, which accelerates heat absorption and melting. Black carbon is a short-lived species that varies spatially, which makes it difficult to quantify its GWP. DPM emissions are a major source of black carbon and are TACs that have been regulated and controlled in California for several decades to protect public health.

Water Vapor. The primary source of water vapor is evaporation from the ocean, with additional vapor generated by sublimation (change from solid to gas) from ice and snow, evaporation from other water bodies, and transpiration from plant leaves. Water vapor is the most important, abundant, and variable GHG in the atmosphere and maintains a climate necessary for life.

Ozone. Tropospheric O_3, which is created by photochemical reactions involving gases from both natural sources and human activities, acts as a GHG. Stratospheric O_3, which is created by the interaction between solar ultraviolet radiation and molecular oxygen (O_2), plays a decisive role in the stratospheric radiative balance. Depletion of stratospheric O_3 due to chemical reactions that may be enhanced by climate change results in an increased ground-level flux of ultraviolet-B radiation.

Aerosols. Aerosols are suspensions of PM in a gas emitted into the air through burning biomass (plant material) and fossil fuels. Aerosols can warm the atmosphere by absorbing and emitting heat and can cool the atmosphere by reflecting light.

3.1.3 Global Warming Potential

Gases in the atmosphere can contribute to climate change both directly and indirectly. Direct effects occur when the gas itself absorbs radiation. Indirect radiative forcing occurs when chemical transformations of the substance produce other GHGs, when a gas influences the atmospheric lifetimes of other gases, and/or when a gas affects atmospheric processes that alter the radiative balance of the Earth (e.g., affect cloud formation or albedo) (EPA 2025f). The Intergovernmental Panel on Climate Change developed the GWP concept to compare the ability of each GHG to trap heat in the atmosphere relative to another gas. The GWP of a GHG is defined as the ratio of the time-integrated radiative forcing from the instantaneous release of 1 kilogram of a trace substance relative to that of 1 kilogram of a reference gas (IPCC 2014). The reference gas used is CO_2; therefore, GWP-weighted emissions are measured in metric tons (MT) of CO_2 equivalent (CO_2e).

The current version of CalEEMod (version 2022.1.1.29) assumes that the GWP for CH_4 is 25 (so emissions of 1 MT of CH_4 are equivalent to emissions of 25 MT of CO_2), and the GWP for N_2O is 298, based on the Intergovernmental

Panel on Climate Change Fourth Assessment Report (IPCC 2007). The GWP values identified in CalEEMod were applied to the project.

3.2 Greenhouse Gas Inventories and Climate Change Conditions

3.2.1 Global Inventory

Anthropogenic GHG emissions worldwide in 2020 (the most recent year for which data is available) totaled approximately 49,800 million metric tons (MMT) of CO_2e, excluding land use change and forestry (PBL 2022). The top six GHG emitters are China, the United States, the Russian Federation, India, Japan, and the European Union, which accounted for approximately 60% of the total global emissions, or approximately 30,270 MMT CO_2e (PBL 2022). Table 3-1 presents the top GHG-emissions-producing countries and regions.

Table 3-1. Top Six Greenhouse Gas Producer Countries and Regions

Emitting Countries/Region	2020 Greenhouse Gas Emissions (MMT CO_2e)[a,b]
China	14,300
United States	5,640
European Union	3,440
India	3,520
Russian Federation	2,210
Japan	1,160
Total	**30,270**

Source: PBL 2022.
Notes: MMT CO_2e = million metric tons of carbon dioxide equivalent.
[a] Column may not add due to rounding.
[b] GHG emissions do not include land use change and forestry-related GHG emissions.

3.2.2 National Inventory

Per the EPA Inventory of U.S. Greenhouse Gas Emissions and Sinks: 1990–2022, total United States GHG emissions were approximately 6,343 MMT CO_2e in 2022 (EPA 2024). Total U.S. emissions have decreased by 3.1% from 1990 to 2022, down from a high of 15.2% above 1990 levels in 2007. Emissions increased from 2021 to 2022 by 0.2% (14.4 MMT CO_2e). Net emissions (i.e., including sinks) were 5,489.3 MMT CO_2e in 2022. Overall, net emissions increased 1.3% from 2021 to 2022 and decreased 16.7% from 2005 levels. From 2021 to 2022, the increase in total GHG emissions was driven largely by an increase in CO_2 emissions from fossil fuel combustion across most end-use sectors due, in part, to increased energy use from the continued rebound of economic activity after the height of the COVID-19 pandemic. The CO_2 emissions from fossil fuel combustion increased by 1.0% from 2021 to 2022 and were 1.1% below emissions in 1990. CO_2 emissions from natural gas use increased by 5.2% (84.80 MMT CO_2e) from 2021, and CO_2 emissions from coal consumption decreased by 6.1% (58.6 MMT CO_2e) from 2021 to 2022 (EPA 2024).

3.2.3 State Inventory

According to California's 2000–2023 GHG emissions inventory (2025 edition), California emitted approximately 360.4 MMT CO_2e in 2023 (CARB 2025m). The sources of GHG emissions in California include transportation, industry, electric power production from both in-state and out-of-state sources, residential and commercial activities, agriculture, high-GWP substances, and recycling and waste. Table 3-2 presents California GHG emission source categories and their relative contributions to the emissions inventory in 2023.

Table 3-2. Greenhouse Gas Emissions Sources in California

Source Category	Annual GHG Emissions (MMT CO_2e)	Percent of Total[a]
Transportation	133.7	37%
Industrial	66.9	19%
Electric Power	57.2	16%
Commercial and Residential	43.3	12%
Agriculture	29.2	8%
High-GWP substances	21.4	6%
Recycling and waste	8.6	2%
Total	360.4	100%

Source: CARB 2025m.
Notes: GHG = greenhouse gas; MMT CO_2e = million metric tons of carbon dioxide equivalent; GWP = global warming potential.
[a] Column may not add due to rounding.

In 2023, emissions from statewide emitting activities were 360.4 MMT CO_2e, 10.7MMT CO_2e (2.9%) lower than 2022 levels. Since the peak level in 2004 of 487 MMT, California's GHG emissions have generally followed a decreasing trend with an approximately 26% decrease from 2004. In 2014, statewide GHG emissions dropped below the 2020 GHG Limit of 431 MMT CO_2e and have remained below the Limit since that time (CARB 2024).

3.2.4 Local Inventory

A GHG emissions inventory and forecast were prepared for the region and each individual jurisdiction in Imperial Valley (Imperial County Transportation Commission 2021). The 2018 GHG inventory follows current protocol for community-wide inventories and includes all major sources of emissions for which the County has direct or indirect jurisdictional control. This inventory estimates GHG emissions from community-wide activities, organized by emissions sector (i.e., energy, transportation, water, waste, and agriculture). Table 3-3 shows the 2018 countywide emissions as provided in the Imperial County Regional Climate Action Plan.

Table 3-3. 2018 Imperial County Greenhouse Gas Emissions by Source

Source	Reported 2018 Annual Greenhouse Gas Emissions (MT CO_2e)	Percent of Total
Energy	98,708	3.5%
Transportation	339,132	11.9%
Water	9,694	0.3%
Waste	49,635	1.7%

Table 3-3. 2018 Imperial County Greenhouse Gas Emissions by Source

Source	Reported 2018 Annual Greenhouse Gas Emissions (MT CO_2e)	Percent of Total
Agriculture	2,342,975	82.5%
Total	**2,840,144**	**100%**

Source: Imperial County Transportation Commission 2021.
Notes: MT CO_2e = metric tons of carbon dioxide equivalent.
Totals may not sum due to rounding.

3.2.5 Potential Effects of Climate Change

The 2009 CEQA Statement of Reasons for Regulatory Action in Implementing SB 97, explained that "[S]ome comments submitted to OPR during its public workshops indicated that the [CEQA] Guidelines should be addressed to 'Climate Change' rather than just the effects of GHG emissions. The focus in the Guidelines on GHG emissions is appropriate" (CNRA 2009). Nevertheless, this section provides an overview of the consequences of GHG emissions.

In California, climate change impacts have the potential to affect sea-level rise, agriculture, snowpack and water supply, forestry, wildfire risk, public health, and electricity demand and supply. The primary effect of global climate change has been a rise in average global tropospheric temperature. Reflecting the long-term warming trend since preindustrial times, observed mean surface temperature for the decade 2006–2015 was approximately 0.87°C (33.6°F) higher than the average over the 1850–1900 period (IPCC 2023). Scientific modeling predicts that continued emissions of GHGs at or above current rates would induce more extreme climate changes during the twenty-first century than were observed during the twentieth century. Human activities are estimated to have caused approximately 1.0°C (1.8°F) of global warming above preindustrial levels, with a likely range of 0.8°C to 1.2°C (1.4°F to 2.2°F) (IPCC 2023). Global warming is likely to reach 1.5°C (2.7°F) between 2030 and 2052 if it continues to increase at the current rate (IPCC 2023).

Although climate change is driven by global atmospheric conditions, climate change impacts are felt locally. A scientific consensus confirms that climate change is already affecting California. The Office of Environmental Health Hazard Assessment identified various indicators of climate change in California, which are scientifically based measurements that track trends in various aspects of climate change. Many indicators reveal discernible evidence that climate change is occurring in California. Changes in the state's climate have been observed, including an increase in annual average air temperature, more frequent extreme heat events, more extreme drought, a decline in winter chill, an increase in cooling degree days and a decrease in heating degree days,[20] and an increase in variability of statewide precipitation (OEHHA 2022b).

Warming temperatures and changing precipitation patterns have altered California's physical systems—the ocean, lakes, rivers, and snowpack—upon which the state depends. Winter snowpack and spring snowmelt runoff from the Sierra Nevada and southern Cascade Mountains provide approximately one-third of the state's annual water supply. Impacts of climate on physical systems have been observed, such as high variability of snow-water content (i.e., amount of water stored in snowpack), decrease in snowmelt runoff, glacier change (loss in area), rise in sea levels,

[20] "Degree days" measure the difference between the average daily temperature and the reference temperature of 65°F. "Cooling" degree days refers to temperatures higher than 65°F (days when cooling devices may be necessary), and "heating" degree days refers to temperatures lower than 65°F (days when heating devices may be necessary) (OEHHA 2022b).

increase in average lake water temperature and coastal ocean temperature, and a decrease in dissolved oxygen in coastal waters (OEHHA 2022b).

Impacts of climate change on biological systems, including humans, wildlife, and vegetation, have also been observed, including climate change impacts on terrestrial, marine, and freshwater ecosystems. As with global observations, species responses include those consistent with warming: elevational or latitudinal shifts in range, changes in the timing of key plant and animal life-cycle events, and changes in the abundance of species and in community composition. Humans are better able to adapt to a changing climate than plants and animals in natural ecosystems. Nevertheless, climate change poses a threat to public health because warming temperatures and changes in precipitation can affect vector-borne pathogen transmission and disease patterns in California, as well as the variability of heat-related deaths and illnesses. In addition, since 1950, the area burned by wildfires each year has been increasing (CNRA 2018a).

The California Natural Resources Agency (CNRA) has released four California Climate Change Assessments (2006, 2009, 2012, and 2018), which have addressed acceleration of warming across the state; more intense and frequent heat waves; greater riverine flows; accelerating sea-level rise; more intense and frequent drought; more severe and frequent wildfires; more severe storms and extreme weather events; shrinking snowpack and less overall precipitation; and ocean acidification, hypoxia (i.e., low oxygen availability), and warming. The Fourth Assessment (CNRA 2018a) includes reports for nine regions of the state, including the Inland Deserts Region, where the project site is located. Key projected climate changes for the Inland Deserts Region include the following (CNRA 2018a):

- Temperatures are becoming more extreme, with daily average high temperatures expected to increase 8°F to 14°F. Higher temperatures will exacerbate water stress in the region.
- Rainfall in the Inland Deserts is extremely variable from year to year, and often as low as 5 inches per year. Increased variability in weather conditions and events will increase the region's susceptibility to flash flooding and wildfires.
- Population in the Inland Deserts is highly vulnerable to climate change, as is tourism, the region's major economic driver.
- Climate change will exacerbate stresses to the limited water supply feeding the Salton Sea and may accelerate the pace of decline through increasing evapotranspiration rates and possible changes in agricultural water management inputs and Colorado River allocations to the region.

Agriculture. Some of the specific challenges faced by the agricultural sector and farmers include more drastic and unpredictable precipitation and weather patterns; extreme weather events that range from severe flooding to extreme drought to destructive storm events; significant shifts in water availably and water quality; changes in pollinator lifecycles; temperature fluctuations, including extreme heat stress and decreased chill hours; increased risks from invasive species and weeds, agricultural pests, and plant diseases; and disruptions to the transportation and energy infrastructure supporting agricultural production (CNRA 2018a).

Biodiversity and Habitat. Specific climate change challenges to biodiversity and habitat include species migration in response to climatic changes; range shift and novel combinations of species; pathogens, parasites, and disease; invasive species; extinction risks; changes in the timing of seasonal life-cycle events; food web disruptions; threshold effects (i.e., a change in the ecosystem that results in a "tipping point" beyond which irreversible damage or loss has occurred) (CNRA 2018a).

Energy. Specific climate change challenges for the energy sector include temperature, fluctuating precipitation patterns, increasing extreme weather events, and sea-level rise (CNRA 2018a).

Forestry. The most significant climate change related risk to forests is accelerated risk of wildfire and more frequent and severe droughts. Droughts have resulted in more large-scale mortalities and, combined with increasing temperatures, have led to an overall increase in wildfire risks. Increased wildfire intensity subsequently increases public safety risks, property damage, fire suppression and emergency response costs, watershed and water quality impacts, and vegetation conversions (CNRA 2018a).

Ocean and Coastal Ecosystems and Resources. Sea-level rise, changing ocean conditions, and other climate change stressors are likely to exacerbate long-standing challenges related to ocean and coastal ecosystems, in addition to threatening people and infrastructure located along the California coastline and in coastal communities. Sea-level rise, in addition to more frequent and severe coastal storms and erosion, are threatening vital infrastructure such as roads, bridges, power plants, ports and airports, gasoline pipes, and emergency facilities, as well as negatively impacting coastal assets such as beaches and tidal wetlands (CNRA 2018a).

Public Health. Climate change can impact public health through various environmental changes, and is the largest threat to human health in the twenty-first century. Changes in precipitation patterns affect public health primarily through potential for altered water supplies, and extreme events such as heat, floods, droughts, and wildfires. Increased frequency, intensity, and duration of extreme heat and heat waves are likely to increase the risk of mortality due to heat-related illness and can exacerbate existing chronic health conditions. Other extreme weather events are likely to negatively impact air quality and increase or intensify respiratory illness, such as asthma and allergies (CNRA 2018a).

Transportation. Although the transportation industry is a source of GHG emissions, it is also vulnerable to climate change risks. Increasing temperatures and extended periods of extreme heat threaten the integrity of roadways and rail lines. High temperatures cause road surfaces to expand, which leads to increased pressure and pavement buckling. High temperatures can also cause rail breakages, which could lead to train derailment. Other forms of extreme weather events, such as extreme storm events, can negatively impact infrastructure, which can impair movement of peoples and goods, or potentially block evacuation routes and emergency access roads. Increased wildfires, flooding, erosion risks, landslides, mudslides, and rockslides can all profoundly impact the transportation system and pose a serious risk to public safety (CNRA 2018a).

Water. Climate change could seriously impact the timing, form, amount, runoff patterns, and frequency and severity of precipitation events. Higher temperatures reduce the amount of snowpack and lead to earlier snowmelt, which can impact water supply availability, natural ecosystems, and winter recreation. Water supply availability during dry summer months is heavily dependent on the snowpack accumulated during the wintertime. Increased risk of flooding has a variety of public health concerns, including water quality, public safety, property damage, displacement, and post-disaster mental health problems. Prolonged and intensified droughts can also negatively impact groundwater reserves and result in increased overdraft and subsidence. The higher risk of wildfires can lead to increased erosion, which can negatively impact watersheds and result in poor water quality (CNRA 2018a).

Local Climate Changes

In Imperial County, mean annual minimum temperatures are projected to rise significantly, with increases over 2°C expected in mean annual, monthly median, and minimum and maximum temperatures. Climate change projections

also indicate alterations in precipitation distribution and vegetation patterns, influenced by the ability of species to migrate and adapt to geographic changes (Imperial County 2016).

3.3 Regulatory Setting

3.3.1 Federal Regulations

Massachusetts v. EPA

In *Massachusetts v. EPA* (April 2007), the U.S. Supreme Court directed the EPA administrator to determine whether GHG emissions from new motor vehicles cause or contribute to air pollution that may reasonably be anticipated to endanger public health or welfare, or whether the science is too uncertain to make a reasoned decision. In December 2009, the administrator signed a final rule with the following two distinct findings regarding GHGs under federal Clean Air Act Section 202(a):

- The administrator found that elevated concentrations of GHGs—CO_2, CH_4, N_2O, HFCs, PFCs, and SF_6—in the atmosphere threaten the public health and welfare of current and future generations. This is the "endangerment finding."
- The administrator further found that the combined emissions of GHGs—CO_2, CH_4, N_2O, and HFCs—from new motor vehicles and new motor vehicle engines contribute to the GHG air pollution that endangers public health and welfare. This is the "cause or contribute finding."

These two findings were necessary to establish the foundation for regulation of GHGs from new motor vehicles as air pollutants under the Clean Air Act (42 USC 7401).

Notably, President Trump's EO 14154 issued on January 10, 2025, called for EPA to consider the legality and applicability of the 2009 Endangerment Finding for Greenhouse Gases, which may limit the ability and scope of the State of California to regulate based upon GHG emissions. On August 1, 2025, the EPA proposed rules to implement this EO (OFR 2025)

Energy Independence and Security Act

The Energy Independence and Security Act of 2007 (EISA; Public Law 110-140), among other key measures, included the following measures to aid in the reduction of national GHG emissions:

- Increase the supply of alternative fuel sources by setting a mandatory Renewable Fuel Standard (RFS) requiring fuel producers to use at least 36 billion gallons of biofuel in 2022.
- Set a target of 35 miles per gallon for the combined fleet of cars and light trucks by model year 2020 and direct the National Highway Traffic Safety Administration (NHTSA) to establish a fuel economy program for medium- and heavy-duty trucks and create a separate fuel economy standard for work trucks.
- Prescribe or revise standards affecting regional efficiency for heating and cooling products and procedures for new or amended standards, energy conservation, energy efficiency labeling for consumer electronic products, residential boiler efficiency, electric motor efficiency, and home appliances.

President Trump's EO 14154 may also impact the EISA. This order declared a national energy emergency and directed federal agencies to expedite the permitting and production of domestic energy resources. This emphasis on increasing fossil fuel production and reducing regulatory barriers may undermine the EISA's objectives of enhancing energy efficiency and promoting renewable energy sources.

Federal Vehicle Standards

In response to the *Massachusetts v. EPA* U.S. Supreme Court ruling discussed above, the Bush Administration issued EO 13432 in 2007 directing the EPA, the Department of Transportation, and the Department of Energy to establish regulations that reduce GHG emissions from motor vehicles, nonroad vehicles, and nonroad engines by 2008. In 2009, NHTSA issued a final rule regulating fuel efficiency and GHG emissions from cars and light-duty trucks for model year 2011; and, in 2010, the EPA and NHTSA issued a final rule regulating cars and light-duty trucks for model years 2012–2016 (75 FR 25324–25728). In March 2022, NHTSA established new fuel economy standards that would require an industry-wide fleet average of approximately 49 miles per gallon for passenger cars and light trucks in model year 2026 by increasing fuel efficiency by 8% annually for model years 2024 and 2025, and 10% annually for model year 2026.

On March 12, 2025, in response to President Trump's EO 14154, EPA stated that it would reconsider its 2024 rules that would cut passenger vehicle fleetwide tailpipe emissions by nearly 50% by 2032 compared with 2027 projected levels. The EPA said it is also reconsidering a 2022 regulation that aims to drastically cut smog- and soot-forming emissions from heavy-duty trucks, saying the rule makes trucks more expensive.

In January 2025, President Trump's Transportation Secretary moved to rescind fuel economy standards issued under President Biden that aimed to reduce fuel use for cars and trucks. He has also frozen funding to states for EV charging. The NHTSA in June 2024 said it would hike Corporate Average Fuel Economy requirements to about 50.4 miles per gallon (4.67 liters per 100 kilometers) by 2031 from 39.1 miles per gallon currently for light-duty vehicles. NHTSA said in June 2024 the rule for passenger cars and trucks would reduce gasoline consumption by 64 billion gallons through 2050 and cut emissions by 659 million metric tons. It said although some vehicles would be more expensive to buy, consumers would save on fuel costs and estimated net benefits of $35.2 billion.

Trump's Transportation Secretary also directed NHTSA to reconsider rules for heavy-duty pickup trucks and vans through 2035.

Executive Order 13990

On January 20, 2021, President Biden issued EO 13990, Protecting Public Health and the Environment and Restoring Science to Tackle the Climate Crisis. Section 7(e) of this EO directs the White House Council on Environmental Quality to rescind the 2019 Draft GHG Guidance and review, revise, and update its 2016 GHG Guidance. Among its key provisions, the EO directed federal agencies to review and potentially revise a range of policies, regulations, and actions that were inconsistent with the Biden administration's commitment to combating climate change and promoting environmental sustainability. The EO also sought to reestablish interagency working groups and committees that had been disbanded or sidelined during the previous administration, with a focus on restoring evidence-based decision-making processes.

The Interagency Working Group on the Social Cost of Greenhouse Gases is a collaborative effort involving multiple U.S. federal agencies, with the goal of providing scientifically sound estimates for the social cost of greenhouse gases. This metric assigns a monetary value to the long-term damages caused by CO_2, CH_4, and N_2O emissions, considering their impacts on climate change, public health, ecosystems, and the economy. The Interagency Working Group released the Technical Support Document: Social Cost of Carbon, Methane, and Nitrous Oxide Interim Estimates under EO 13990 in February 2021. The Technical Support Document contains methodologies, data, and analyses used by the Interagency Working Group to develop interim estimates for the social cost of carbon, methane, and nitrous oxide emissions under (IWG 2021).

Inflation Reduction Act of 2022

The Inflation Reduction Act (IRA) was signed into law by President Biden in August 2022. The bill provides for specific investment in energy and climate reform, and is projected to reduce GHG emissions within the United States by 40% compared to 2005 levels by 2030. The bill allocates funds to boost renewable energy infrastructure (e.g., solar panels and wind turbines), includes tax credits for the purchase of EVs, and includes measures that will make homes more energy efficient.

The IRA authorized the EPA to implement the Greenhouse Gas Reduction Fund program, which is a historic, $27 billion investment to mobilize financing and private capital to combat the climate crisis and ensure American economic competitiveness. The Greenhouse Gas Reduction Fund will be designed to achieve the following program objectives: reduce GHG emissions and other air pollutants; deliver the benefits of GHG- and air-pollution-reducing projects to American communities, particularly low-income and disadvantaged communities; and mobilize financing and private capital to stimulate additional deployment of GHG- and air-pollution-reducing projects (EPA 2025g).

The IRA confirms that reduction of GHGs is a core goal of the Clean Air Act and that the funding provided should allow the EPA to increase the scope of its Clean Air Act rulemakings. The act also confirms applicability of the IRA to GHGs in three specific areas: (1) California's ability to regulate GHG emissions from vehicles; (2) the EPA's authority to regulate CH_4 emissions from oil and gas facilities; and (3) the EPA's authority to regulate GHG emissions from power plants.

On July 4, 2025, President Trump enacted the One Big Beautiful Bill Act (OBBBA), which reduces the scope of the IRA and accelerates the phase-out of multiple IRA clean-energy incentives, such as residential energy and EV credits. The OBBBA also rescinds substantial federal funding for clean energy, environmental justice, and climate resilience programs, including the Greenhouse Gas Reduction Fund. Furthermore, on July 7, 2025, President Trump signed the EO 14315, which reinforces the changes made under the OBBBA, further hindering clean energy programs by eliminating taxpayer subsidies for wind, solar, and other clean energy sources.

3.3.2 State Regulations

The statewide GHG emissions regulatory framework is summarized in this subsection by category: state climate change targets, building energy, renewable energy and energy procurement, mobile sources, water, solid waste, and other state actions. The following text describes EOs, ABs, SBs, and other plans and policies that aim to directly or indirectly reduce GHG emissions and/or address climate change issues.

State Climate Change Targets

Assembly Bill 32

In furtherance of the goals established in EO S-3-05, the Legislature enacted AB 32, the California Global Warming Solutions Act of 2006 (California Health and Safety Code Sections 38500–38599 et seq.). AB 32 provided initial direction on creating a comprehensive multiyear program to limit California's GHG emissions at 1990 levels by 2020, and initiated the transformations required to achieve the state's long-range climate objectives. In 2016, the State of California achieved its 2020 GHG emission reduction targets as annual emissions fell below 431 MMT of CO_2e.

Senate Bill 32 and Assembly Bill 197

SB 32 and AB 197 (enacted in 2016) are companion bills. SB 32 codified the 2030 emissions reduction goal of EO B-30-15 by requiring CARB to ensure that statewide GHG emissions are reduced to 40% below 1990 levels by 2030. AB 197 established the Joint Legislative Committee on Climate Change Policies, consisting of at least three members of the Senate and three members of the Assembly, to provide ongoing oversight over implementation of the state's climate policies. AB 197 also added two members of the Legislature to the Board as nonvoting members; requires CARB to make available and update (at least annually via its website) emissions data for GHGs, criteria air pollutants, and TACs from reporting facilities; and requires CARB to identify specific information for GHG emissions reduction measures when updating the Scoping Plan.

Executive Order S-3-05

EO S-3-05 (June 2005) established California's GHG emissions reduction targets and laid out responsibilities among the state agencies for implementing the EO and for reporting on progress toward the targets. This EO established the following targets:

- By 2010, reduce GHG emissions to 2000 levels
- By 2020, reduce GHG emissions to 1990 levels
- By 2050, reduce GHG emissions to 80% below 1990 levels

EO S-3-05 also directed the California Environmental Protection Agency to report biannually on progress made toward meeting the GHG targets and the impacts to California due to global warming, including impacts to water supply, public health, agriculture, the coastline, and forestry.

Executive Order B-30-15

EO B-30-15 (April 2015) identified an interim GHG reduction target in support of targets previously identified under EO S-3-05 and AB 32. EO B-30-15 set an interim target goal of reducing GHG emissions to 40% below 1990 levels by 2030 to keep California on its trajectory toward meeting or exceeding the long-term goal of reducing GHG emissions to 80% below 1990 levels by 2050, as set forth in EO S-3-05. These orders are only applicable to "state agencies with jurisdiction over sources of greenhouse gas emissions" (Order 4-29-2015 Section 2). Imperial County does not fall within the definition of a State agency.

Executive Order B-55-18

EO B-55-18 (September 2018) establishes a statewide policy for the state to achieve carbon neutrality as soon as possible (but no later than 2045), and achieve and maintain net-negative emissions thereafter. The goal is an addition to the existing statewide targets of reducing the state's GHG emissions. CARB will work with relevant state agencies to ensure that future Scoping Plans identify and recommend measures to achieve the carbon neutrality goal.

California Air Resources Board's Climate Change Scoping Plan

One specific requirement of AB 32 is for CARB to prepare a "Scoping Plan" for achieving the maximum technologically feasible and cost-effective GHG emission reductions by 2020 (California Health and Safety Code Section 38561[a]), and to update the plan at least once every 5 years. In 2008, CARB approved the first Scoping Plan, the Climate Change Scoping Plan: A Framework for Change (2008 Scoping Plan). The 2008 Scoping Plan included a mix of recommended strategies that combined direct regulations, market-based approaches, voluntary measures, policies, and other emission reduction programs calculated to meet the 2020 statewide GHG emission limit and initiate the transformations needed to achieve the state's long-range climate objectives (CARB 2008).

In 2014, CARB approved the first update to the 2008 Scoping Plan. The First Update to the Climate Change Scoping Plan: Building on the Framework (First Update) defined the state's GHG emission reduction priorities for the next 5 years and laid the groundwork to start the transition to the post-2020 goals set forth in EO S-3-05 and EO B-16-2012 (CARB 2014). The First Update concluded that California was on track to meet the 2020 target, but recommended a 2030 midterm GHG reduction target be established to ensure a continuum of action to reduce emissions. The First Update recommended a mix of technologies in key economic sectors to reduce emissions through 2050, including energy demand reduction through efficiency and activity changes; large-scale electrification of on-road vehicles, buildings, and industrial machinery; decarbonizing electricity and fuel supplies; and the rapid market penetration of efficient and clean energy technologies.

In December 2017, CARB released the 2017 Climate Change Scoping Plan Update (Second Update) for public review and comment (CARB 2017a). The Second Update built on the successful framework established in the 2008 Scoping Plan and First Update while identifying new technologically feasible and cost-effective strategies that served as the framework to achieve the 2030 GHG target and define the state's climate change priorities to 2030 and beyond. The strategies' "known commitments" included implementing renewable energy and energy efficiency (including the mandates of SB 350), increased stringency of the Low Carbon Fuel Standard (LCFS), measures identified in the Mobile Source and Freight Strategies, measures identified in the proposed Short-Lived Climate Pollutant Plan, and increased stringency of SB 375 targets. To fill the gap in additional reductions needed to achieve the 2030 target, the Second Update recommended continuing the Cap-and-Trade Program and a measure to reduce GHGs from refineries by 20%. The Second Update was approved by CARB's Governing Board on December 14, 2017.

In December 2022, CARB approved the 2022 Scoping Plan, which outlines the state's plan to reduce anthropogenic emissions to 85% below 1990 levels by 2045, and achieve carbon neutrality by 2045 or earlier. The 2022 Scoping Plan also assesses the progress the state is making toward reducing GHG emissions by at least 40% below 1990 levels by 2030, as is required by SB 32 and laid out in the Second Update. The carbon neutrality goal requires CARB to expand proposed actions from only the reduction of anthropogenic sources of GHG emissions to also include those that capture and store carbon (e.g., through natural and working lands, or mechanical technologies). The carbon reduction programs build on and accelerate those currently in place, including moving to zero-emission

transportation; phasing out use of fossil gas use for heating homes and buildings; reducing use of chemicals and refrigerants with high GWP; providing communities with sustainable options for walking, biking, and public transit; displacement of fossil-fuel-fired electrical generation through use of renewable energy alternatives (e.g., solar arrays and wind turbines); and scaling up new options, such as green hydrogen.[21]

Lithium batteries play an important part of the 2022 Scoping Plan, which calls for increased battery EV adoption, 20% of aviation fuel demand to be met by battery-powered electrification/fuel cells with a transition to zero-emission technologies by 2045, and increased battery storage. The 2022 Scoping Plan identifies a demand for "11 million battery electric and hydrogen fuel cell vehicles in 2035 and over 23 million battery electric and hydrogen fuel cell vehicles in 2045" (CARB 2022). The 2022 Scoping Plan further explains that "Renewable energy is consistent during the middle of the day, but it cannot meet all of the evening demand…fossil gas generation is currently a resource that is typically ramped up to meet this evening demand as solar production begins to drop and electrical loads increase. To help address this challenge, resource installations that pair solar with batteries, as well as a greater amount of battery buildout…" (CARB 2022). The 2022 Scoping Plan estimates a demand of 37 gigawatts of battery storage by 2045 (CARB 2022).

The 2022 Scoping Plan also emphasizes that there is no realistic path to carbon neutrality without carbon removal and sequestration, and to achieve the state's carbon neutrality goal, carbon reduction programs must be supplemented by strategies to remove and sequester carbon. Strategies for carbon removal and sequestration include carbon capture and storage from anthropogenic point sources, where CO_2 is captured as it leaves a facility's smokestack and is injected into geologic formations or used in industrial materials (e.g., concrete), and CO_2 removal from ambient air through mechanical (e.g., direct air capture with sequestration) or nature-based (e.g., management of natural and working lands) applications.

The 2022 Scoping Plan recommends strategies for implementation at the statewide level to meet the goals of AB 32, SB 32, AB 1279, and the EOs; it also establishes an overall framework for the measures that will be adopted to reduce California's GHG emissions.

California Air Resources Board's Regulations for the Mandatory Reporting of Greenhouse Gas Emissions

CARB's Regulation for the Mandatory Reporting of Greenhouse Gas Emissions (17 CCR 95100–95157) incorporated by reference certain requirements that EPA promulgated in its Final Rule on Mandatory Reporting of Greenhouse Gases (40 CFR 98). Specifically, Section 95100(c) of the Mandatory Reporting Regulation incorporated those requirements that EPA promulgated in the Federal Register on October 30, 2009; July 12, 2010; September 22, 2010; October 28, 2010; November 30, 2010; December 17, 2010; and April 25, 2011. In general, entities subject to the Mandatory Reporting Regulation that emit more than 10,000 MT CO_2e per year are required to report annual GHGs through the California Electronic GHG Reporting Tool. Certain sectors, such as refineries and cement plants, are required to report regardless of emission levels. Entities that emit more than the 25,000 MT CO_2e per year threshold are required to have their GHG emissions report verified by a CARB-accredited third party.

[21] Green hydrogen refers to hydrogen generated by renewable energy or from low-carbon power; it has significantly lower associated carbon emissions than gray hydrogen, which is produced using natural gas and makes up the majority of hydrogen production. For the purposes of the Draft 2022 Scoping Plan, the term "green hydrogen" is not limited to only electrolytic hydrogen produced from renewables.

Senate Bill 605 and Senate Bill 1383

SB 605 (2014) requires CARB to complete a comprehensive strategy to reduce emissions of short-lived climate pollutants in the state (California Health and Safety Code Section 39730), and SB 1383 (2016) requires CARB to approve and implement that strategy by January 1, 2018 (PRC Sections 42652–43654). SB 1383 also establishes specific targets for the reduction of short-lived climate pollutants (40% below 2013 levels by 2030 for CH_4 and HFCs, and 50% below 2013 levels by 2030 for anthropogenic black carbon), and provides direction for reductions from dairy and livestock operations and landfills. Accordingly, CARB adopted its Short-Lived Climate Pollutant Reduction Strategy in March 2017. This strategy establishes a framework for the statewide reduction of emissions of black carbon, CH_4, and fluorinated gases (CARB 2017b).

Assembly Bill 1279

The Legislature enacted AB 1279, the California Climate Crisis Act, in September 2022. The bill declares the policy of the state to achieve net-zero GHG emissions as soon as possible, but no later than 2045, and achieve and maintain net-negative GHG emissions thereafter.

Although AB 1279 establishes an overall policy to achieve net-zero GHG emissions as soon as possible, but no later than 2045, recognizing the need to implement CO_2 removal and carbon capture, utilization, and storage technologies, the Legislature established a specific target of 85% below 1990 levels by 2045 for anthropogenic GHG emissions. Therefore, the net-zero target does not directly apply to development projects, but the 2045 target of 85% below 1990 levels represents the reductions required to accomplish the state's overall net-zero policy.

Building Energy

Title 24 of the California Code of Regulations requires California homes and businesses to meet strong energy efficiency measures, thereby lowering their energy use. Title 24 contains numerous subparts, including Part 1 (Administrative Code), Part 2 (Building Code), Part 3 (Electrical Code), Part 4 (Mechanical Code), Part 5 (Plumbing Code), Part 6 (Energy Code), Part 8 (Historical Building Code), Part 9 (Fire Code), Part 10 (Existing Building Code), Part 11 (Green Building Standards Code), Part 12 (Referenced Standards Code). The California Building Code is applicable to all development in California (Health and Safety Code Sections 17950 and 18938[b]).

California Code of Regulations, Title 24, Part 6 (Energy Code)

The California Building Standards Code was established in 1978 and serves to enhance and regulate California's building standards. Part 6 of Title 24 specifically established Building Energy Efficiency Standards that are designed to ensure that new and existing buildings in California achieve energy efficiency and preserve outdoor and indoor environmental quality. These energy efficiency standards are reviewed every few years by the Building Standards Commission and the CEC, and revised if necessary (PRC Section 25402[b][1]). The regulations receive input from members of industry and the public to "reduce the wasteful, uneconomic, inefficient, or unnecessary consumption of energy" (PRC Section 25402). Every 3 years, these regulations are carefully scrutinized and analyzed for technological and economic feasibility (PRC Section 25402[d]) and cost effectiveness (PRC Section 25402[b][2–3]). As a result, these standards save energy, increase electricity supply reliability, increase indoor comfort, avoid the need to construct new power plants, and help preserve the environment.

The 2022 standards improved upon the 2019 standards for new construction of, and additions and alterations to, residential and nonresidential buildings. The CEC updates the Title 24 Energy Code every 3 years. The CEC adopted the 2022 Title 24 Energy Code in August 2021, and the California Building Standards Commission approved incorporating the updated code into the California Building Standards Code in December 2021.

The CEC formally adopted the 2025 Title 24 Energy Code on September 11, 2024, which was then approved by the California Building Standards Commission on December 17, 2024, making its effective date January 1, 2026. Buildings whose permit applications are applied for on or after January 1, 2026, must comply with the 2025 Energy Code. The 2025 Energy Code updates for residential and nonresidential buildings introduce several key changes aimed at improving energy efficiency and supporting the state's climate goals. These include enhanced mechanical system standards, such as updated requirements for heating, ventilation, and air conditioning and heat pump water heaters, and stronger building envelope performance to reduce energy loss. Electrical systems now require more advanced lighting controls and expanded testing protocols. The code also adds readiness provisions for solar and battery storage installations and includes laboratories under its scope for energy-intensive processes. Compliance tools and manuals have been revised to reflect new modeling rules.

Starting in 2020, the California Energy Code was revised to require solar, and the 2022 Code required "All single-family residential buildings shall have a newly installed PV system or newly installed PV modules meeting the minimum qualification requirements specified in Joint Appendix JA11" (24 CCR Part 6, Section 150.1[c][14]). The California Energy Code was further updated in 2022 to require solar for multifamily buildings, and energy storage for structures greater than three habitable stories (24 CCR Part 6, Section 170.2[f], [g], [h]). Similarly, solar PV and energy storage are now required for grocery stores, offices, financial institutions, unleased tenant space, retail, schools, warehouses, auditoriums, convention centers, hotels/motels, libraries, medical office buildings/clinics, restaurants, theaters, and mixed-use buildings where one or more of these building types constitute at least 80% of the floor area (24 CCR Part 6, Section 140.10[a]). The 2025 standards expand upon requirements for PV and battery storage infrastructure compared to previous standards, including requiring readiness for connection with BESS system infrastructure in certain single-family homes.

The 2025 amendments include measures that will further reduce energy use in single-family, multifamily, and nonresidential buildings through the following strategies (CEC 2024a):

- For homes, use heat pumps for both space heating and water heating, expanding on the single heat pump baselines in the 2022 update.
- For nonresidential building types, expanding on the single zone heat pump baselines in the 2022 update.
- For low-rise multifamily buildings with individual water heaters in dwelling units, use heat pump water heater baselines, expanding on the space heating heat pump baselines in the 2022 update.
- Encouraging electric-ready buildings to set up owners to use cleaner electric water heating and cooking when they are ready to invest in those technologies.
- Updating photovoltaic and battery energy storage system standards for high-rise multifamily and nonresidential buildings to achieve cost-effective installations in consideration of revised net billing and virtual net billing rules.
- Updating space conditioning system control standards for nonresidential buildings.
- Updating ventilation requirements in multifamily buildings to improve indoor air quality.

California Code of Regulations, Title 24, Part 11

In addition to the CEC's efforts, in 2008, the California Building Standards Commission adopted the nation's first green building standards. The California Green Building Standards Code (Part 11 of Title 24) is commonly referred to as California's Green Building Standards (CALGreen). CALGreen establishes minimum mandatory standards and voluntary standards pertaining to the planning and design of sustainable site development, energy efficiency (in excess of the California Energy Code requirements), water conservation, material conservation, and interior air quality. CALGreen took effect in January 2011 and instituted mandatory minimum environmental performance standards for all ground-up, new construction of commercial, low-rise residential and state-owned buildings and schools and hospitals. The CEC formally adopted the 2025 Title 24 Energy Code on September 11, 2024, which was then approved by the California Building Standards Commission on December 17, 2024, making its effective date January 1, 2026. Buildings whose permit applications are applied for on or after January 1, 2026, must comply with the 2025 Energy Code. The 2025 Energy Code updates for nonresidential buildings introduces several key changes aimed at improving energy efficiency and supporting the state's climate goals. These include enhanced mechanical system standards, such as updated requirements for heating, ventilation, and air conditioning and heat pump water heaters, and stronger building envelope performance to reduce energy loss. Electrical systems now require more advanced lighting controls and expanded testing protocols. The code also adds readiness provisions for solar and battery storage installations and includes laboratories under its scope for energy-intensive processes. Compliance tools and manuals have been revised to reflect new modeling rules, and the updates continue to align with CALGreen standards for sustainability, including water efficiency and indoor air quality.

California Code of Regulations, Title 20

Title 20 of the California Code of Regulations requires manufacturers of appliances to meet state and federal standards for energy and water efficiency (20 CCR 1401–1410 et seq.). The CEC certifies an appliance based on a manufacturer's demonstration that the appliance meets the standards. New appliances regulated under Title 20 include refrigerators, refrigerator-freezers, and freezers; room air conditioners and room air conditioning heat pumps; central air conditioners; spot air conditioners; vented gas space heaters; gas pool heaters; plumbing fittings and plumbing fixtures; fluorescent lamp ballasts; lamps; emergency lighting; traffic signal modules; dishwaters; clothes washers and dryers; cooking products; electric motors; low-voltage dry-type distribution transformers; power supplies; televisions and consumer audio and video equipment; and battery charger systems. Title 20 presents protocols for testing each type of appliance covered under the regulations, and appliances must meet the standards for energy performance, energy design, water performance, and water design. Title 20 contains three types of standards for appliances: federal and state standards for federally regulated appliances, state standards for federally regulated appliances, and state standards for non-federally regulated appliances.

Renewable Energy and Energy Procurement

SB 1078, EO-14-08, SBX1-2, SB 350, SB 100, SB 1020

SB 1078 (Sher) (September 2002) established the Renewables Portfolio Standard (RPS) program, which required an annual increase in renewable generation by the utilities equivalent to at least 1% of sales, with an aggregate goal of 20% by 2017. EO S-14-08 (November 2008) required that all retail suppliers of electricity in California serve 33% of their load with renewable energy by 2020. SB X1 2 expanded the RPS by establishing a renewable energy target of 20% of the total electricity sold to retail customers in California per year by December 31, 2013, and 33% by December 31, 2020, and in subsequent years. SB 350 (October 2015) further expanded the RPS

by establishing a goal of 50% of the total electricity sold to retail customers in California per year by December 31, 2030. SB 100 (2018) increased the standards set forth in SB 350, establishing that 44% of the total electricity sold to retail customers in California per year by December 31, 2024, 52% by December 31, 2027, and 60% by December 31, 2030, be secured from qualifying renewable energy sources. SB 100 states that it is the policy of the state that eligible renewable energy resources and zero-carbon resources supply 100% of the retail sales of electricity to California. SB 1020 (September 2022) revises the standards from SB 100, requiring the following percentage of retail sales of electricity to California end-use customers to come from eligible renewable energy resources and zero-carbon resources: 90% by December 31, 2035; 95% by December 31, 2040; and 100% by December 31, 2045.

Mobile Sources

State Vehicle Standards (Assembly Bill 1493 and Executive Order B-16-12)

AB 1493 (July 2002) was enacted in response to the transportation sector accounting for more than half of California's CO_2 emissions. AB 1493 required CARB to set GHG emission standards for passenger vehicles, light-duty trucks, and other vehicles determined by the State Board to be vehicles that are primarily used for noncommercial, personal transportation in the state. The bill required that CARB set GHG emission standards for motor vehicles manufactured in 2009 and all subsequent model years. CARB adopted the standards in September 2004. EO B-16-12 (March 2012) required that state entities under the governor's direction and control support and facilitate the rapid commercialization of zero-emission vehicles (ZEVs). It ordered CARB, the CEC, the California Public Utilities Commission (CPUC), and other relevant agencies to work with the Plug-in Electric Vehicle Collaborative and the California Fuel Cell Partnership to establish benchmarks to help achieve goals established for 2015, 2020, and 2025. On a statewide basis, EO B-16-12 established a target reduction of GHG emissions from the transportation sector equaling 80% less than 1990 levels by 2050. This directive did not apply to vehicles that have special performance requirements necessary for the protection of the public safety and welfare. EPA and the NHTSA approved the Safer Affordable Fuel-Efficient (SAFE) Vehicles Rule Parts One and Two, which revoked California's authority to set its own GHG emissions standards and set ZEV mandates in California. Furthermore, individual cities and counties lack the ability to regulate fuel economy standards. 42 USC Section 7543(a) states: "No state or any political subdivision therefore shall adopt or attempt to enforce any standard relating to the control of emissions from new motor vehicles or new motor vehicle engines subject to this part."

In 2020, the EPA and the NHTSA approved the Trump administration's SAFE Vehicles Rule Part One and Two, which revoked California's authority to set its own GHG emissions standards and set ZEV mandates in California, and sought to reduce fuel economy standards. However, in March 2022, EPA reinstated California's authority under the Clean Air Act to implement its own GHG emission standards and ZEV sales mandate. EPA's action concluded its reconsideration of the 2019 SAFE-1 rule by finding that the actions taken under the previous administration as a part of SAFE-1 were decided in error and were entirely rescinded.

However, in 2025 the President of the United States signed an executive order, *Unleashing American Energy*, which directed the EPA to eliminate the social cost of carbon calculation from any federal permitting or regulatory decision and submit recommendations on the legality and continued applicability of the 2009 endangerment finding, among other directives (White House 2025). On July 29, 2025, the EPA released its proposal to rescind the 2009 endangerment finding and repeal all GHG emission standards for light-duty, medium-duty, and heavy-duty vehicles and engines pursuant to CAA section 202(a) (EPA 2025). The proposed rule would remove GHG-related provisions

from 40 CFR part 600 without affecting provisions related to CAFE standards and fuel economy labeling. (Vol. 90 Federal Register, No. 146, 36288.)

In May 2025, the U.S. Senate approved several bills under the Congressional Review Act which purported to rescind California's Clean Air Act waiver which allows California to regulate fuel economy. (H.J.Res. 87, H.J.Res. 88, H.J.Res. 89.) However, the U.S. Senate Parliamentarian and the Government Accountability Office (GAO) concluded that that the bills were illegal (GAO 2025). Consequently, California filed a lawsuit challenging the revocations. (See *State of California et al v. U.S.A et al.* (2025) N.D. Cal Case No. 25-CV-04966 challenging disapproval of California's Clean Air Act waivers which allowed California to set its own vehicular fuel economy standards) (California V.US EPA2025).

Furthermore, it is legally infeasible for individual cities and counties to regulate fuel economy standards. 42 U.S.C. § 7543(a) states: "No state or any political subdivision therefore shall adopt or attempt to enforce any standard relating to the control of emissions from new motor vehicles or new motor vehicle engines subject to this part."Heavy-Duty Diesel

CARB adopted the final Heavy-Duty Truck and Bus Regulation on December 31, 2014, to reduce DPM, a major source of black carbon, and NOx emissions from heavy-duty diesel vehicles (13 CCR 2025). The rule requires DPM filters be applied to newer heavier trucks and buses by January 1, 2012, with older vehicles required to comply by January 1, 2015. The rule required nearly all diesel trucks and buses to be compliant with the 2010 model year engine requirement by January 1, 2023. CARB also adopted an Airborne Toxic Control Measure on December 12, 2013, to limit idling of diesel-fueled commercial vehicles. This rule requires diesel-fueled vehicles with gross vehicle weights greater than 10,000 pounds to idle no more than 5 minutes at any location (13 CCR 2485).

Executive Order S-1-07

EO S-1-07 (January 2007, implementing regulation adopted in April 2009) sets a declining LCFS for GHG emissions measured in CO_2e grams per unit of fuel energy sold in California. The target of the LCFS is to reduce the carbon intensity of California passenger vehicle fuels by at least 10% by 2020 (17 CCR 95480 et seq.). The carbon intensity measures the amount of GHG emissions in the life cycle of a fuel—including extraction/feedstock production, processing, transportation, and final consumption—per unit of energy delivered. In September 2018, CARB approved amendments for the LCFS that require a 20% reduction in carbon intensity by 2030.

Senate Bill 375

SB 375 (California Government Code Section 65080 amendment, 2008) addresses GHG emissions associated with the transportation sector through regional transportation and sustainability plans. SB 375 requires CARB to adopt regional GHG reduction targets for the automobile and light-truck sector for 2020 and 2035, and to update those targets every 8 years. SB 375 requires the state's 18 regional metropolitan planning organizations to prepare an SCS as part of their RTP that will achieve the GHG reduction targets set by CARB. If a metropolitan planning organization is unable to devise an SCS to achieve the GHG reduction target, the metropolitan planning organization must prepare an Alternative Planning Strategy demonstrating how the GHG reduction target would be achieved through alternative development patterns, infrastructure, or additional transportation measures or policies.

A SCS does not (i) regulate the use of land; (ii) supersede the land use authority of cities and counties; or (iii) require that a city's or county's land use policies and regulations, including those in a General Plan, be consistent with it (California Government Code Section 65080[b][2][K]). Nonetheless, SB 375 makes regional and local planning

agencies responsible for developing those strategies as part of the federally required metropolitan transportation planning process and the state-mandated Housing Element process. In April 2024, SCAG approved its most recent RTP/SCS, Connect SoCal, which included updated targets of an 8% per capita reduction below 2005 levels by 2020 and a 19% per capita reduction by 2035 (SCAG 2024).

Advanced Clean Cars Program and Zero-Emission Vehicle Program

The Advanced Clean Cars (ACC) I program (January 2012) is an emissions control program for model years 2015 through 2025. The program combines the control of smog- and soot-causing pollutants and GHG emissions into a single coordinated package of regulations: the Low-Emission Vehicle regulation for criteria air pollutant and GHG emissions, and a technology-forcing regulation for ZEVs that contributes to both types of emission reductions (CARB 2025n). The package includes elements to reduce smog-forming pollution, reduce GHG emissions, promote clean cars, and provide the fuels for clean cars. To improve air quality, CARB has implemented new emission standards to reduce smog-forming emissions beginning with 2015 model year vehicles. It is estimated that by 2025, cars will emit 75% less smog-forming pollution than the average new car sold in 2015. The ZEV program will act as the focused technology of the ACC I program by requiring manufacturers to produce increasing numbers of ZEVs and plug-in hybrid EVs in the 2018 to 2025 model years.

The ACC II program, which was adopted in August 2022, established the next set of low-emission vehicle and ZEV requirements for model years after 2025 to contribute to meeting federal ambient air quality O_3 standards and California's carbon neutrality standards (CARB 2025n). The main objectives of ACC II are as follows:

- Maximize criteria and GHG emission reductions through increased stringency and real-world reductions.
- Accelerate the transition to ZEVs through both increased stringency of requirements and associated actions to support wide-scale adoption and use.

The ACC II rulemaking package also considers technological feasibility, environmental impacts, equity, economic impacts, and consumer impacts.

Executive Order N-79-20

EO N-79-20 (September 2020) requires CARB to develop regulations as follows: (1) passenger vehicle and truck regulations requiring increasing volumes of new ZEVs sold in the state toward the target of 100% of in-state sales by 2035; (2) medium- and heavy-duty vehicle regulations requiring increasing volumes of new zero-emission trucks and buses sold and operated in the state toward the target of 100% of the fleet transitioning to ZEVs by 2045 everywhere feasible and for all drayage trucks to be zero emission by 2035; and (3) strategies, in coordination with other state agencies, the EPA, and local air districts, to achieve 100% zero-emission from off-road vehicles and equipment operations in the state by 2035. EO N-79-20 called for the development of a Zero-Emission Vehicle Market Development Strategy, which was released February 2021, to be updated every 3 years, that ensures coordination and implementation of the EO and outlines actions to support new and used ZEV markets. In addition, the EO specifies identification of near-term actions and investment strategies to improve clean transportation, sustainable freight, and transit options, and calls for development of strategies, recommendations, and actions by July 15, 2021, to manage and expedite the responsible closure and remediation of former oil extraction sites as the state transitions to a carbon-neutral economy.

Advanced Clean Trucks Regulation

The Advanced Clean Trucks Regulation was approved by CARB in 2020. The purpose of the Advanced Clean Trucks Regulation is to accelerate the market for ZEVs in the medium- and heavy-duty truck sector, and to reduce air pollutant emissions generated from on-road mobile sources (CARB 2025o). The regulation has two components: (1) a manufacturer sales requirement and (2) a reporting requirement, as follows:

- **Zero-emission truck sales:** Manufacturers who certify Class 2b–8 chassis or complete vehicles with combustion engines will be required to sell zero-emission trucks as an increasing percentage of their annual California sales from 2024 to 2035. By 2035, zero-emission truck/chassis sales would need to be 55% of Class 2b–3 truck sales, 75% of Class 4–8 straight truck sales, and 40% of truck tractor sales.
- **Company and fleet reporting:** Large employers, including retailers, manufacturers, brokers, and others, will be required to report information about shipments and shuttle services. Fleet owners with 50 or more trucks will be required to report about their existing fleet operations. This information will help identify future strategies to ensure that fleets purchase available zero-emission trucks and place them in service where suitable to meet their needs.

Water

Executive Order B-29-15

In response to the ongoing drought in California, EO B-29-15 (April 2015) set a goal of achieving a statewide reduction in potable urban water usage of 25% relative to water use in 2013. The term of the EO extended through February 28, 2016, although many of the directives have become permanent water efficiency standards and requirements. The EO includes specific directives that set strict limits on water usage in the state. In response to EO B-29-15, the California Department of Water Resources has modified and adopted a revised version of the Model Water Efficient Landscape Ordinance that, among other changes, significantly increases the requirements for landscape water use efficiency and broadens its applicability to include new development projects with smaller landscape areas.

Executive Order N-10-21

In response to a state of emergency due to severe drought conditions, EO N-10-21 (July 2021) called on all Californians to voluntarily reduce their water use by 15% from their 2020 levels. Actions suggested in EO N-10-21 include reducing landscape irrigation, running dishwashers and washing machines only when full, finding and fixing leaks, installing water-efficient showerheads, taking shorter showers, using a shutoff nozzle on hoses, and taking cars to commercial car washes that use recycled water.

Solid Waste

Assembly Bill 939, Assembly Bill 341, Assembly Bill 1826, and Senate Bill 1383

In 1989, AB 939, known as the Integrated Waste Management Act (PRC Section 40000 et seq.), was passed because of the increase in waste stream and the decrease in landfill capacity. The statute established the California Integrated Waste Management Board (replaced in 2010 by the California Department of Resources Recycling and Recovery [CalRecycle]), which oversees a disposal reporting system. AB 939 required

jurisdictions to meet diversion goals of all solid waste through source reduction, recycling, and composting activities of 25% by 1995 and 50% by 2000.

AB 341 (2011) amended the California Integrated Waste Management Act of 1989 to include a provision declaring that it is the policy goal of the state that not less than 75% of solid waste generated be source-reduced, recycled, or composted by 2020, and annually thereafter. In addition, AB 341 required CalRecycle to develop strategies to achieve the state's policy goal. CalRecycle conducted multiple workshops and published documents that identified priority strategies that it believed would assist the state in reaching the 75% goal by 2020.

AB 1826 (Chapter 727, Statutes of 2014, effective 2016) requires businesses to recycle their organic waste (i.e., food waste, green waste, landscape and pruning waste, nonhazardous wood waste, and food-soiled paper waste that is mixed in with food waste) depending on the amount of waste they generate per week. This law also requires local jurisdictions across the state to implement an organic waste recycling program to divert organic waste generated by businesses, including multifamily residential dwellings that consist of five or more units. The minimum threshold of organic waste generation by businesses decreases over time, which means an increasingly greater proportion of the commercial sector will be required to comply.

SB 1383 (2016) requires a 50% reduction in organic waste disposal from 2014 levels by 2020, and a 75% reduction by 2025—essentially requiring the diversion of up to 27 million tons of organic waste—to reduce GHG emissions. SB 1383 also requires that not less than 20% of edible food that is currently disposed of be recovered for human consumption by 2025.

Other State Actions

Senate Bill 97

SB 97 (2007) directed the Governor's Office of Planning and Research and the California Natural Resources Agency to develop guidelines under CEQA for the mitigation of GHG emissions. The California Natural Resources Agency adopted the CEQA Guidelines amendments in December 2009, which became effective in March 2010.

Under the amended CEQA Guidelines, a lead agency has the discretion to determine whether to use a quantitative or qualitative analysis or apply performance standards to determine the significance of GHG emissions resulting from a particular project (14 CCR 15064.4[a]). The CEQA Guidelines require a lead agency to consider the extent to which the project complies with regulations or requirements adopted to implement a statewide, regional, or local plan for the reduction or mitigation of GHG emissions (14 CCR 15064.4[b]). The CEQA Guidelines also allow a lead agency to consider feasible means of mitigating the significant effects of GHG emissions, including reductions in emissions through the implementation of project features or off-site measures (14 CCR 15126.4[c]). The adopted amendments do not establish a GHG emission threshold, instead allowing a lead agency to develop, adopt, and apply its own thresholds of significance or those developed by other agencies or experts. The California Natural Resources Agency also acknowledged that a lead agency could consider compliance with regulations or requirements implementing AB 32 in determining the significance of a project's GHG emissions (CNRA 2009).

With respect to GHG emissions, CEQA Guidelines Section 15064.4(a), as subsequently amended in 2018, states that lead agencies "shall make a good-faith effort, based to the extent possible on scientific and factual data, to describe, calculate or estimate" GHG emissions. The CEQA Guidelines now note that an agency "shall have discretion to determine, in the context of a particular project, whether to (1) Quantify greenhouse gas emissions

resulting from a project; and/or (2) Rely on a qualitative analysis or performance-based standards" (14 CCR 15064.4[a]). Section 15064.4(b) states that the lead agency should consider the following when assessing the significance of impacts from GHG emissions on the environment: (1) the extent to which a project may increase or reduce GHG emissions as compared to the existing environmental setting; (2) whether project emissions exceed a threshold of significance that the lead agency determines applies to the project; and (3) the extent to which the project complies with regulations or requirements adopted to implement a statewide, regional, or local plan for the reduction or mitigation of GHG emissions (14 CCR 15064.4[b]).

Executive Order S-13-08

EO S-13-08 (November 2008) is intended to hasten California's response to the impacts of global climate change, particularly sea-level rise. Therefore, the EO directs state agencies to take specified actions to assess and plan for such impacts. The final 2009 California Climate Adaptation Strategy report was issued in December 2009, and an update, Safeguarding California: Reducing Climate Risk, followed in July 2014. To assess the state's vulnerability, the report summarizes key climate change impacts to the state for the following areas: agriculture, biodiversity and habitat, emergency management, energy, forestry, ocean and coastal ecosystems and resources, public health, transportation, and water. Issuance of the Safeguarding California: Implementation Action Plans followed in March 2016. In January 2018, the California Natural Resources Agency released the Safeguarding California Plan: 2018 Update, which communicates current and needed actions that state government should take to build climate change resiliency (CNRA 2018b).

Blue Ribbon Commission and Governor Newsom

AB 1657 took effect on January 1, 2021, and required CEC to convene and establish a Blue Ribbon Commission on Lithium Extraction in California, commonly referred to as the Lithium Valley Commission, composed of 14 representatives and experts, to review, investigate, and analyze specific topics relating to lithium extraction in California and submit a report to the Legislature, documenting its findings and any recommendations developed after conducting the required review and analyses. In a crucial milestone toward making California a global leader in the production of lithium, the Lithium Valley Commission submitted its report of findings and recommendations to the state Legislature in December 2022 (Paz et al. 2022). The report concludes that the market demand for lithium-ion batteries will increase tenfold between 2020 and 2030.

The Report also acknowledges the need for a domestic source to serve this demand, highlighting lithium extraction rom geothermal brines as a potential supply stream. Furthermore, the Report explains the additional benefit of processing the lithium and manufacturing the lithium products in the Salton Sea region instead of outsourcing to overseas regions. According to the Report, a domestic manufacturing process would reduce environmental impacts of lithium-dependent products on a life-cycle basis. The Report concludes that "the state should continue to support the success of environmentally preferable, California-based lithium recovery facilities." Governor Newsom has similarly acknowledged that the state "aims to produce lithium in a more sustainable and environmentally safe way than nearly anywhere else in the world, by relying on modern extraction techniques rather than harmful hard rock mining or other traditional tools of extraction" (Office of Governor Gavin Newsom 2023).

3.3.3 Local Regulations

3.3.3.1 County of Imperial

Imperial County General Plan

Goals and policies pertaining to improving air quality are addressed in multiple chapters of the General Plan. The Conservation and Climate Change Element includes the following goals, objectives and policies related to reducing GHG emissions and the effects of climate change on the region:

Conservation and Climate Change Element

Objective 7.6: Explore and assess strategies to reduce greenhouse gas emissions in the County.

Policy 5b: Work cooperatively with ICTC and other appropriate agencies to reduce vehicle miles traveled countywide in order to improve air quality and reduce greenhouse gas emissions.

Policy 5c: Promote alternative transportation programs, policies, and development in order to reduce vehicle miles traveled and address air quality and greenhouse gas emissions.

Renewable Energy and Transmission Element

Goal 1: Support the safe and orderly development of renewable energy while providing for the protection of environmental resources.

Imperial County Regional Climate Action Plan

Adopted in June 2021, the ICRCAP serves both the ICTC and SCAG. The ICRCAP includes both emissions inventories for various jurisdictions in the Imperial Valley and identifies GHG reduction strategies and measures that would be implemented at the regional level to address climate change. The ICRCAP was prepared as an aspirational guiding document for the region to implementing GHG reduction measures that would reduce regional GHG emissions consistent with State targets and goals. The ICRCAP is not a qualified plan under CEQA Guidelines 15183.5.

Goal: Transportation

Strategy T-1: Reduce Vehicle Miles Travelled

- *Measure T-1.2: Plan and implement a system of bicycle lanes and multi-use trails that link the cities, unincorporated communities, schools, commercial/retail, employment centers, health care service facilities, public transportation, and other points of interest.*

Strategy T-2: Reduce Fuel Consumption

- *Measure T-2.2: Synchronize traffic signals to reduce idling.*
- *Measure T-2.4: Work with the air district to establish an incentive program to trade in fossil fuel-powered landscaping equipment with electric versions.*

Strategy T-3: Increase Use of Zero Emission/Alternative Fuel Vehicles

- *Measure T-3.2: Install public electric vehicle (EV) charging stations.*
- *Measure T-3.3: Require electric vehicle charging stations at new non-residential developments.*

Goal: Energy

Strategy E-1: Increase Energy Resiliency

- *Measure E-1.3: Reduce or eliminate natural gas and propane consumption in new and existing residential buildings.*

Strategy E-2: Increase Renewable and Zero-Carbon Energy Generation

- *Measure E-2.3: Reduce or eliminate natural gas and propane consumption in new and existing residential buildings.*
- *Measure E-2.6: Establish or join program to increase grid-supply renewable and zero-carbon electricity.*

Goal: Waste

Strategy WS-1: Reduce and Recycle Solid and Organic Wastes

- *Measure WS-1.2: Promote alternative uses of agricultural and organic waste by promoting the construction of composting and anaerobic digestion facilities.*
- *Measure WS-1.3: Create waste diversion ordinances for construction projects.*

Goal: Agriculture

Strategy AG-1: Improve Farming and Grazing Practices

- *Measure AG-1.1: Work with utilities and/or air districts to provide incentives such as CARB's FARMER program to convert stationary diesel- or gas-powered irrigation pumps to electric pumps that are connected to the grid or use off-grid alternative/renewable energy sources, such as solar.*
- *Measure AG-1.3: Provide incentives for replacing gas- or diesel-powered agricultural equipment with electric or alternatively fueled equivalents.*

Strategy AG-2: Promote Carbon Sequestration and Land Conservation

- *Measure AG-2.1: Consider various agricultural land and open space conservation strategies that allow developers to preserve lands and/or increase residential development density in smart growth infill areas by removing development potential of lands.*
- *Measure AG-2.2: Target stream restoration programs and riparian restoration strategies for carbon sequestration, natural heat relief, water quality improvements, and/or wildlife habitat mitigation.*

- *Measure AG-2.4: Develop and enforce landscape tree requirement for new developments.*

Draft Lithium Valley Specific Plan

The Draft LVSP was published in February 2025 and was prepared by the County to proactively establish a clear path forward toward an environmentally-conscious employment hub, called Lithium Valley, which will assist in meeting the nation's increasing demands for lithium and other minerals present in the Salton Sea KGRA. See Section 2.2.3.3 for a detailed discussion of the Draft LVSP and its policies, programs, conditions, and design standards relevant to GHG emissions.

3.3.3.2 Southern California Association of Governments

As noted above, California's 18 MPOs have been tasked with creating SCSs in an effort to reduce the region's VMT in order to help meet AB 32 targets through integrated transportation, land use, housing, and environmental planning. Pursuant to SB 375, CARB set per capita GHG emission reduction targets from passenger vehicles for each of the state's 18 MPOs. For SCAG, the state's initial mandated reductions were set at 8% by 2020 and 13% by 2035. In March 2018, CARB updated the SB 375 targets for SCAG to require 8% reduction by 2020 and a 19% reduction by 2035 in per capita passenger vehicle GHG emissions.

Pursuant to Government Code Section 65080(b)(2)(B), the SCS must "set forth forecasted development pattern for the region which when integrated with the transportation network, and other transportation measures and policies, will reduce the GHG emissions from automobiles and light trucks to achieve the GHG reduction targets." To that end, SCAG has developed Connect SoCal, the 2024–2050 RTP/SCS, which complies with CARB's updated emissions reduction targets and meets the requirements of SB 375 by achieving per capita GHG emission reductions relative to 2005 of 8% by 2020 and 19% by 2035 (SCAG 2024). The 2024–2050 RTP/SCS is a long-range visioning plan that balances future mobility and housing needs with economic, environmental, and public health goals, and charts a path toward a more mobile, sustainable, and prosperous region by making connections between transportation networks, between planning strategies, and between the people whose collaboration can improve the quality of life for Southern Californians. Connect SoCal embodies a collective vision for the region's future and is developed with input from local governments, county transportation commissions, tribal governments, nonprofit organizations, businesses, and local stakeholders within the counties of Imperial, Los Angeles, Orange, Riverside, San Bernardino, and Ventura.

The 2024–2050 RTP/SCS states goals (1) Mobility: Build and maintain a robust transportation network; (2) Communities: Develop, connect and sustain communities that are livable and thriving; (3) Environment: Create a healthy region for the people of today and tomorrow; and (4) Economy: support a sustainable, efficient, and productive regional economic environment that provides opportunities for all residents. The RTP acknowledges that "New and emerging technologies have had a significant impact on the transportation sector, transforming various aspects of mobility, efficiency, safety and user experience. These technologies include advancements in vehicle technology, like electric vehicles" and "how zero-emission vehicles can strengthen resilience through vehicle-to-grid technologies or other opportunities where batteries can be used to enhance capacity of renewable energy sources." The "Plan also strives to achieve broader regional objectives, such as increased housing production, improved equity and resilience, the preservation of natural lands, improvement of public health, increased transportation safety, support for the region's vital goods movement industries and more efficient use of resources."

SCAG also adopted Resolution No. 23-653-1, which emphasizes the need for projects and strategies that ensure a safe, resilient, and efficient supply chain and goods movement system. The resolution also highlights that, due to the volume of trade in the SCAG region, which is home to the largest port complex in the country, the SCAG [must] develop strategies to accommodate growing freight movement" (SCAG 2023).

The RTP/SCSs do not require that local General Plans, Specific Plans, or zoning be consistent with it but provide incentives for consistency for governments and developers.

3.4 Significance Criteria and Methodology

3.4.1 Thresholds of Significance

California Environmental Quality Act Guidelines

The significance thresholds/criteria used to evaluate the proposed project's GHG emissions impacts are based on the recommendations provided in Appendix G of the CEQA Guidelines (14 CCR 15000 et seq.). For the purposes of this GHG emissions analysis, the proposed project would have a significant environmental impact if it would:

a) Generate GHG emissions, either directly or indirectly, that may have a significant impact on the environment
b) Conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of GHGs

Global climate change is a cumulative impact; a project participates in this potential impact through its incremental contribution combined with the cumulative increase of all other sources of GHGs.

With respect to GHG emissions, CEQA Guidelines Section 15064.4(a) states that lead agencies "shall make a good-faith effort, based to the extent possible on scientific and factual data, to describe, calculate or estimate" GHG emissions resulting from a project. The CEQA Guidelines note that an agency has the discretion to either quantify a project's GHG emissions or rely on a "qualitative analysis or performance-based standards" (14 CCR 15064.4[a]). A lead agency may use a "model or methodology" to estimate GHG emissions and has the discretion to select the model or methodology it considers "most appropriate to enable decision makers to intelligently take into account the project's incremental contribution to climate change" (14 CCR 15064.4[c]). The CEQA Guidelines provide that the lead agency should consider the following when determining the significance of impacts from GHG emissions on the environment (14 CCR 15064.4[b]):

1. The extent to which a project may increase or reduce greenhouse gas emissions as compared to the existing environmental setting.
2. Whether the project emissions exceed a threshold of significance that the lead agency determines applies to the project.
3. The extent to which the project complies with regulations or requirements adopted to implement a statewide, regional, or local plan for the reduction or mitigation of greenhouse gas emissions.

In addition, the CEQA Guidelines specify that "[w]hen adopting or using thresholds of significance, a lead agency may consider thresholds of significance previously adopted or recommended by other public agencies, or recommended by experts, provided the decision of the lead agency to adopt such thresholds is supported by

substantial evidence" (14 CCR 15064.7[c]). The CEQA Guidelines do not indicate an amount of GHG emissions that constitutes a significant impact on the environment.

The extent to which a project increases or decreases GHG emissions in the existing environmental setting should be estimated in accordance with CEQA Guidelines Section 15064.4, Determining the Significance of Impacts from Greenhouse Gas Emissions. The CEQA Guidelines indicate that when calculating GHG emissions resulting from a project, lead agencies should make a good-faith effort based on scientific and factual data (14 CCR 15064.4[a]) and that lead agencies have the discretion to select the model or methodology deemed most appropriate for enabling decision makers to intelligently assess the project's incremental contribution to climate change (14 CCR 15064.4[c]).

Governor's Office of Planning and Research Guidance

The Governor's Office of Planning and Research (now the Governor's Office of Land use and Climate Innovation) technical advisory CEQA and Climate Change: Addressing Climate Change through California Environmental Quality Act (CEQA) Review states that "public agencies are encouraged but not required to adopt thresholds of significance for environmental impacts. Even in the absence of clearly defined thresholds for GHG emissions, the law requires that such emissions from CEQA projects must be disclosed and mitigated to the extent feasible whenever the lead agency determines that the project contributes to a significant, cumulative climate change impact" (OPR 2008). Furthermore, the advisory document indicates that "in the absence of regulatory standards for GHG emissions or other scientific data to clearly define what constitutes a 'significant impact,' individual lead agencies may undertake a project-by-project analysis, consistent with available guidance and current CEQA practice" (OPR 2008).

Approach to Determining Significance

Consistent with CEQA Guidelines Section 15064.4(b)(1), Threshold GHG-a assesses whether the proposed project would generate GHG emissions, either directly or indirectly, that may have a significant impact on the environment. Threshold GHG-a evaluation includes a comparison to the Plan Area (GHG-a1) and global baseline conditions (GHG-a2). Under the "Plan Area Emissions Baseline" comparison, the proposed project's emissions are quantified and compared to appropriate emission-based thresholds. The analysis under Threshold GHG-a2 qualitatively considers the effects of the renewable energy produced under the LVSP within the global context, including the benefits of developing a domestic lithium supply.

To address Threshold GHG-a1, the estimated project's GHG emissions are compared to an appropriate numeric threshold based on substantial evidence. The ICAPCD has not established quantitative significance thresholds for evaluating GHG emissions in CEQA analyses. The SCAQMD, based on substantial evidence as provided in the Draft Guidance Document – Interim CEQA Greenhouse Gas Significance Threshold (SCAQMD 2008) and subsequent Working Group meetings (latest in 2010), proposed a threshold of 3,000 MT CO_2e per year for GHG impacts. This threshold is based on the 90% capture rate methodology, which means that 90% of total emissions from all new or modified projects would be subject to some type of CEQA analysis, which was the approach taken by SCAQMD to establish the stationary/industrial source threshold and by CARB (for interim threshold for stationary source projects).[22] The 3,000 MT CO_2e per year threshold is not tied to the 2020 target year and is thus not outdated.

[22] The quantitative threshold based on market capture threshold was also one of the options suggested by the California Air Pollution Control Officers Association.

Further, this threshold has been used for hundreds, if not thousands, of GHG analyses performed for projects located within SCAQMD's jurisdiction.

Per SCAQMD guidance, construction emissions should be amortized over the operational life of the project, which is assumed to be 30 years (SCAQMD 2008). This impact analysis, therefore, adds amortized construction emissions to the estimated annual operational emissions and then compares operational emissions to the applied threshold of 3,000 MT CO_2e per year. As discussed previously, the GHG emissions associated with implementation of the LVSP were estimated using industry standard and accepted software tools, techniques, and emissions factors, as described in Section 3.4.2. Project-generated construction and operational GHG emissions are calculated and presented in Section 3.5.1.

As noted above, to address Threshold GHG-a2, the project is qualitatively evaluated in a broader context, considering a global baseline.

To address Threshold GHG-b, the potential for the proposed project to conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of GHGs, the LVSP's potential to conflict with state GHG reduction targets contained in the 2022 Scoping Plan, SCAG's 2024–2050 RTP/SCS, and relevant measures within the ICRCAP is qualitatively evaluated. A project is considered consistent with the provisions of these documents if it meets the general intent in reducing emissions and does not impede attainment of those goals. However, a given project need not be in perfect conformity with each and every planning policy or goal to be consistent. A project would be consistent with applicable plans, policies, and regulations if it would further their objectives and not obstruct their attainment.

3.4.2 Approach and Methodology

3.4.2.1 Construction Emissions

Construction Scenario Assumptions

CalEEMod Version 2022.1.1.29 was used to estimate potential project-generated GHG emissions during construction. Construction of the proposed project would result in GHG emissions primarily associated with the use of off-road construction equipment, on-road hauling and vendor (material delivery) trucks, and worker vehicles. All details for construction criteria air pollutants discussed in Section 2.3.2.1, Construction Emissions, are also applicable for the estimation of construction-related GHG emissions. As such, see Section 2.3.2.1 for a discussion of construction emissions calculation methodology and assumptions.

3.4.2.2 Operational Emissions

Operational Emission Source Assumptions

As with the air quality analysis, emissions from the operational phase of the proposed project were estimated primarily using CalEEMod Version 2022.1.29. Consistent with the phasing outlined in the Operational Land Use Assumptions subsection, three operational scenarios were evaluated, as follows:

- Phase 1 (2035): Includes operations of land uses constructed during Phase 1 (2025–2034)
- Phase 2 (2045): Includes operations of land uses constructed through Phase 2 (2035–2044)

- **Total Buildout (2055):** Includes operations of land uses constructed through Phase 3 (2045–2054)

Specific project acreages and operations are based on the land use development buildout designed for the project. The CalEEMod land use development summary for the proposed project under buildout in each of the operational scenarios is the same as presented in the air quality analysis tables in the Operational Land Use Assumptions subsection.

Mobile Sources

All details for criteria air pollutants discussed in the Operational Emission Source Assumptions subsections are also applicable for the estimation of operational mobile source GHG emissions.

Regulatory measures related to mobile sources include AB 1493 (Pavley) and related federal standards. AB 1493 required that CARB establish GHG emission standards for automobiles, light-duty trucks, and other vehicles that are primarily used for noncommercial personal transportation in the state. In addition, the NHTSA and EPA have established corporate fuel economy standards and GHG emission standards, respectively, for automobiles and light-, medium-, and heavy-duty vehicles. Implementation of these standards and fleet turnover (replacement of older vehicles with newer ones) will gradually reduce emissions from the project's motor vehicles. The effectiveness of fuel economy improvements was evaluated using the CalEEMod emission factors for motor vehicles to the extent it was captured in CalEEMod 2022.1.1.29, which is based on EMFAC2021. However, these calculations do not take into account the project's ability to displace existing or future trips.

Area Sources

CalEEMod was used to estimate GHG emissions from the project's area sources, including operation of gasoline-powered landscape maintenance equipment, which produces minimal GHG emissions. See the Operational Emission Source Assumptions subsection for a discussion of landscaping equipment emissions calculations. Consumer product use and architectural coatings result in VOC emissions, which are analyzed in the air quality analysis only because they have little to no GHG emissions.

Energy Sources

GHGs are emitted from buildings as a result of activities for which electricity and natural gas are typically used as energy sources. Combustion of any type of fuel emits CO_2 and other GHGs directly into the atmosphere; these emissions are considered direct emissions associated with a building (building energy use emissions do not include street lighting).[23] GHGs are also emitted during the generation of electricity from fossil fuels; these emissions are considered to be indirect emissions.

GHG emissions associated with the LVSP's natural gas and electricity usage were calculated in CalEEMod using a combination of land-use-specific electricity consumption inputs and default parameters. Default CalEEMod values were applied for most land uses, which includes natural gas and electricity use. See Section 4.3.2.2 for a complete description of energy sources modeling within CalEEMod.

[23] The CalEEMod emissions inventory model does not include indirect emissions related to street lighting. Indirect emissions related to street lighting are expected to be negligible and cannot be accurately quantified at this time because there is insufficient information as to the number and type of street lighting that would occur.

The CalEEMod default energy intensity factors (CO_2, CH_4, and N_2O mass emissions per kWh) for IID were adjusted based on the value for IID's 2023 Power Content Label as the baseline and the projected energy mix pursuant to the RPS requirements applicable for the operational year, as follows (CEC 2023):

- Phase 1 (2035): 90% renewables assumed per SB 1020
- Phase 2 (2045): 100% renewables assumed per SB 1020
- Phase 3 or Full Buildout (2055): 100% renewables assumed per SB 1020

Water and Wastewater

Supply, conveyance, treatment, and distribution of water for the LVSP require the use of electricity, which would result in associated indirect GHG emissions. Similarly, wastewater generated by the LVSP's land uses requires the use of electricity for conveyance and treatment, along with GHG emissions generated during wastewater treatment.

The indoor and outdoor water use and electricity consumption from water use and wastewater generation were estimated using plan-specific water use consumption estimates based on the building square footage of each land use. CalEEMod default values were used for the land uses where specific water and wastewater consumption estimates were not available.

Solid Waste

Land uses associated with the project would generate solid waste that is disposed and would therefore result in CO_2e emissions associated with landfill off-gassing (e.g., anaerobic breakdown of material).

No diversion of solid waste was assumed for the LVSP; however, this is a conservative assumption, as AB 939 had a statewide goal of 50% diversion by 2000, AB 341 had a statewide goal of 75% diversion by 2020, and both the state and the County continue to strive to reduce or divert landfill material. Furthermore, the newly formed County of Imperial Infrastructure Special District is expected to coordinate solid waste collection in accordance with the requirements of SB 1383, which mandates organic waste diversion and reductions in landfill disposal. These efforts will ensure compliance with state regulations while maintaining efficient waste management services within the district. CalEEMod default values were used for the land uses where specific solid waste estimates were not available.

Refrigerants

Refrigerants are substances used in equipment for air conditioning and refrigeration. Most of the refrigerants used today are HFCs or blends thereof, which can have high GWP values. All equipment that uses refrigerants has a charge size (i.e., quantity of refrigerant the equipment contains) and an operational refrigerant leak rate, and each refrigerant has a GWP specific to that refrigerant. CalEEMod quantifies refrigerant emissions from leaks during regular operation and routine servicing over the equipment lifetime and then derives average annual emissions from the lifetime estimate.

GHG emissions associated with the use of refrigerants during operations associated with the LVSP were calculated by CalEEMod using default parameters. Default CalEEMod values were applied for most land uses; however, alternative assumptions were applied to certain land uses to more accurately assess refrigerant emissions, as detailed below.

Land uses with alternative assumptions:

- **Solar, Substations, BESS, Floatovoltaics, Agrivoltaics:** Project operations of these land uses were modeled to include fugitive emissions of SF_6., which is widely used as an insulating gas in high-voltage circuit breakers, switchgear, and other electrical equipment included at each of these land uses. SF_6 has a GWP of 23,900, using CO_2 at a reference value of 1 (IPCC 2007). It was assumed that each of these land uses would maintain a total of 500 pounds of SF_6 gas. Although leakage is unlikely, for the purposes of the LVSP's emissions inventory, it was assumed that the breakers would have a maximum annual leak rate of 0.5% in accordance with Institute of Electrical and Electronics Engineers PC37.122, Standard for High-Voltage Gas-Insulated Substations Rated Above 52 kilovolts (IEEE 2011).

Off-Road Equipment

All details for criteria air pollutants discussed in the Operational Emission Source Assumptions subsection are applicable for the estimation of operational off-road equipment GHG emissions. Per HP-7, Equipment Exhaust Minimization, all off-road equipment used for operations shall meet EPA-rated Tier 4 Final engines. GHG emissions associated with usage of off-road equipment were calculated using CalEEMod.

Stationary Sources

All details for stationary sources criteria air pollutants discussed in the Operational Emission Source Assumptions subsection are applicable for the estimation of operational stationary sources GHG emissions. GHG emissions associated with stationary equipment were calculated using CalEEMod and spreadsheet models.

3.5 Impact Analysis

3.5.1 Would the project generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?

Regional Comparison

The purpose of the regional comparison is to quantify project-generated construction and operational GHG emissions and to compare emissions to the SCAQMD 3,000 MT CO_2e per year emission-based threshold.

For the purposes of this GHG emissions analysis, baseline emissions are assumed to be 0 MT CO_2e per year, which is conservative because existing operation of the Plan Area land uses would generate GHG emissions from mobile sources, energy demand, area sources, water use, solid waste generation, and agricultural operations.

Quantification of Greenhouse Gas Emissions

Construction Emissions

Construction of future development that would be facilitated by the LVSP would result in GHG emissions, which are primarily associated with use of off-road construction equipment, on-road haul trucks, on-road vendor trucks, and worker vehicles.

CalEEMod was used to calculate the annual GHG emissions based on the construction scenario discussed in the Construction Scenario Assumptions subsection.

Table 3-4 presents the estimated GHG emissions generated during each year of construction for the three construction phases. Details of the emission calculations are provided in Appendix A.

Table 3-4. Estimated Annual Construction Greenhouse Gas Emissions – Unmitigated

Year	CO_2	CH_4	N_2O	R	CO_2e
	Metric Tons per Year

2054	12,984.26	0.33	0.41	0.30	13,113.99
				Phase 3 Subtotal	**151,604.16**
				Total Construction Emissions	**862,795.96**
				Amortized 30-Year Construction Emissions	*28,759.87*

Notes: CO_2 = carbon dioxide; CH_4 = methane; N_2O = nitrous oxide; R = refrigerant; CO_2e = carbon dioxide equivalent.
Totals may not sum due to rounding.
See Appendix A, Construction CalEEMod Files, for complete results.

As shown in Table 3-4, the estimated total GHG emissions during construction would be approximately 862,796 MT CO_2e over the 30-year construction period, without mitigation. Estimated project-generated construction emissions amortized over 30 years would be approximately 28,760 MT CO_2e per year. As with project-generated construction criteria air pollutant emissions, GHG emissions generated during construction of the project would last only for the duration of the construction period.

Operational Emissions

Operation of the project would generate GHG emissions through vehicle trips by residents, employees, customers, and visitors to and from the project site; landscape maintenance equipment operation; energy use (generation of electricity consumed by the project and minor natural gas use); solid waste disposal; water supply, treatment, and distribution; wastewater treatment; off-road maintenance equipment; and refrigerants. CalEEMod was used to calculate the annual GHG emissions based on the operational assumptions described in Section 3.4.2.2, Operation.

Operation of the LVSP would also implement LVSP Program HP-7, Equipment Exhaust Minimization, which requires that all off-road equipment used for operational and maintenance activity across the LVSP area be electric or net-zero emissions. Tables 3-5 through 3-10 reflect the reduction in GHG emissions from the implementation of PDF-AQ-2.

Table 3-5 shows the annual GHG emissions associated with interim LVSP operation for each land use after Phase 1 construction (year 2035). Details of the emission calculations are provided in Appendix B.

Emissions shown in Table 3-6 reflect the implementation of Program HP-7 during operation.
See Appendix B, Operational CalEEMod Files, for complete results.

As shown in Table 3-6, operation of the project in Phase 2 in 2045 would result in approximately 543,299 MT CO_2e per year.

Table 3-7 shows the annual GHG emissions associated with buildout LVSP operation for each land use after Phase 3 construction (year 2055). Details of the emission calculations are provided in Appendix B.

See Appendix B, Operational CalEEMod Files, for complete results.

As shown in Table 3-7, operation of the LVSP buildout in 2055 would result in approximately 652,032 MT CO_2e per year.

The estimated operational GHG emissions by emissions source are shown in the tables below for each interim operational year and buildout, and the total emissions are compared to thresholds.

Table 3-8 presents estimated annual operational GHG emissions from Phase 1 in 2035.

Table 3-8. Estimated Annual Operational Greenhouse Gas Emissions – Phase 1 – 2035

				Exceeds Threshold?	**Yes**

Notes: CO_2 = carbon dioxide; CH_4 = methane; N_2O = nitrous oxide; R= refrigerant; CO_2e = carbon dioxide equivalent.
Totals may not sum due to rounding.
Emissions shown in Table 3-10 reflect the implementation of Program HP-7 during operation.
See Appendix B, Operational CalEEMod Files, for complete results.
[a] Emissions are representative of the total construction emissions from Phases 1+2+3 over 30 years (See Table 3-4).

As shown in Table 3-10, operation of the buildout of the LVSP would result in approximately 687,389 MT CO_2e per year, which exceeds the threshold of 3,000 MT CO_2e per year, as well as baseline emissions (0 MT CO_2e per year).[24]

Although not quantified in this analysis, as explained above, geothermal and solar (floatovoltaics) would be included in the buildout of the LVSP, which are eligible renewables in the RPS program to help the state meet its goals to decarbonize the grid by 2045. The project would also include rooftop solar, which would provide on-site energy to help meet regional grid demand and reduce consumption in the Plan Area. Although SB 100 requires California's grid to achieve zero GHG emissions by 2045, the continued development of these renewable energy facilities would remain critical for the state to achieve this goal. As such, although not quantified, GHG emissions from on-site renewable energy sources is anticipated to reduce project-generated energy source GHG emissions.

In summary, operation of the LVSP plus amortized construction GHG emissions would exceed the applied threshold of 3,000 MT CO_2e per year, as well as baseline emissions (0 MT CO_2e per year) in Phase 1 (2035), Phase 2 (2045), and Phase 3 (2055). As such, the project would result in a significant impact per Threshold 1 (potential to generate GHG emissions, either directly or indirectly, that may have a significant impact on the environment) prior to mitigation.

Global Comparison

The purpose of the global comparison is to evaluate the broader GHG emissions reduction benefits of the LVSP that may not be captured through industry standard CEQA thresholds. The global comparison does not rely on a numerical threshold but instead evaluates how the LVSP supports global decarbonization through the

[24] For the purposes of this GHG emissions analysis, baseline emissions are assumed to be 0 metric tons carbon dioxide equivalent per year, which is conservative because existing operation of the Specific Plan Area would generate GHG emissions from various sources.

development of clean energy facilities, the increase of the domestic lithium supply chain, and the transition to zero-emission technologies.

The implementation of the LVSP would support the development of the lithium supply chain, including extraction and battery production, thereby offering substantial potential for long-term global GHG reductions beyond those required under CEQA, as detailed below.

Meeting the Growing Demand for Lithium

The growing demand for lithium is underscored by the goals and forecasts of the 2022 Scoping Plan, which calls for increased battery EV adoption, increased battery storage, and for 20% of aviation fuel demand to be met by battery-powered electrification/fuel cells, with a transition to zero-emission technologies by 2045. The 2022 Scoping Plan identifies a demand for "11 million battery electric and hydrogen fuel cell vehicles in 2035 and over 23 million battery electric and hydrogen fuel cell vehicles in 2045" (CARB 2022). The 2022 Scoping Plan further explains that although renewably sourced energy is abundant during off-peak hours, the grid cannot fully meet peak evening demand (when solar generation declines) with renewable electricity. To address this challenge and provide reserves for renewably sourced electricity, the 2022 Scoping Plan highlights the importance of BESS systems, estimating a demand of 37 gigawatts of battery storage by 2045 (CARB 2022).

The LVSP would help to meet this demand by developing a large-scale supply of lithium, an essential component of batteries used in EVs and grid-scale storage systems. The Plan Area is estimated to contain up to 18 million MT of lithium carbonate equivalent (LCE) (Berkeley Lab 2022) and is one of the largest known lithium reserves in the country. Full buildout of the LVSP would include the development of up to 17 direct lithium extraction facilities, which are projected to yield approximately 578,000 MT of LCE per year.[25] By comparison, total global production in 2024, excluding domestic production, was approximated at 240,000 MT of LCE (USGS 2024). As discussed in the Lithium Valley Blue Ribbon Commission Report, under existing conditions "almost all of the global lithium supply is mined in Argentina, Chile, China, and Australia," and the global lithium demand is "expected to grow as much as tenfold in the next decade, but virtually none is produced in the United States" (Paz et al. 2022). The lithium produced by the LVSP could support the manufacture of over 16 million 60-kilowatt lithium-ion batteries, to be used for both grid-scale energy storage and EVs (Paz et al. 2022). Increasing the production of lithium in the region and domestically would help the state and the country to meet the growing demand for battery materials critical to decarbonization.

Benefits of a Domestic Lithium Supply Chain

As discussed above, under existing conditions, lithium extraction, mining, processing, and battery production occur largely overseas, necessitating the United States' large-scale import of lithium battery products. The absence of a fully developed domestic lithium supply chain presents a significant opportunity to reduce global GHG emissions from the lithium battery life cycle. The Lithium Valley Blue Ribbon Commission Report states that "locating the processing and manufacturing of [lithium] products near the source of lithium would be meaningful in realizing the full value and potential environmental benefit of this resource" and that "the state should continue to support the success of environmentally preferable, California-based lithium recovery facilities" (Paz et al. 2022).

[25] The annual lithium carbonate equivalent production for one direct lithium extraction (DLE) facility was conservatively estimated at 34,000 MT based on the design capacity of the Hell's Kitchen Integrated Lithium and Power Project located in the Specific Plan Area. This value reflects a commercially viable DLE scale for the region.

Although some additional domestic lithium supplies have been proposed, the Plan Area, as previously stated, contains one of the largest known lithium reserves in the country. Moreover, California has one of the largest lithium demands in the nation, evinced by the state's aggressive EV and zero-emission technology targets underscored in the CARB 2022 Scoping Plan. In the third quarter of 2024, combined sales of hybrid vehicles, plug-in hybrid EVs, and battery EVs comprised 21.2% of all new California car sales (EIA 2024a), and California accounted for 35% of national EV registrations (USDOE 2024). The LVSP promotes the development of green industrial and manufacturing, with the goal of "compounding, processing, assembling, packaging, treatment or fabrication of materials and products such as lithium batteries and renewable energy plant equipment," with lithium extracted within the Plan Area. The development of a vertically integrated domestic supply chain, from extraction to product production, would reduce global life-cycle emissions by minimizing GHG emissions associated with international transport.

By enabling the development of an integrated domestic lithium supply chain and supporting large-scale electrification, the LVSP would not only help the state reach its GHG reduction and carbon neutrality targets but would also result in indirect global GHG reduction benefits.

Conclusion

Per the Threshold GHG-1a analysis, the project would generate GHG emissions that would exceed the applied threshold of 3,000 MT CO_2e per year. Per the Threshold GHG-1b analysis, although not quantified herein, the project is anticipated to result in global GHG reduction benefits associated with developing a domestic lithium supply. Nonetheless, because the project would result in construction and operational GHG emissions that would exceed the 3,000 MT CO_2e per year threshold, the project would result in a **significant impact without mitigation**.

Mitigation Measures

To reduce potentially significant impacts under Thresholds GHG-1 and GHG-2, MM-GHG-1 through MM-GHG-4 are identified to reduce project-generated construction and operational GHG emissions from various project emission sources. Mitigation measures are grouped into general and land-use-specific mitigation to appropriately address both typical emission sources and the land use emission sources unique to the project. Implementation of MM-TRA-1 through MM-TRA-4, would also reduce GHG emissions through transportation measures and VMT reduction.

MM-GHG-1 Energy Conservation. Prior to the issuance of building permits, the project applicant or its designee shall provide evidence to the County of Imperial that the building design plans include the following energy conservation measures:

- Install Energy Star–rated heating, cooling, lighting, and appliances.
- Outdoor lighting shall be light emitting diode (LED) or other high-efficiency lightbulbs.
- Install double-pane windows where possible.
- Prior to the issuance of building permits, the project applicant or its designee shall submit building plans illustrating installation of cool pavements in place of dark pavements. Outdoor pavements, such as walkways and patios, shall use paving materials with a 3-year solar reflectance index (SRI) of 0.28 or an initial SRI of 0.33.
- Provide information on energy efficiency, energy-efficient lighting and lighting control systems, energy management, and existing energy incentive programs to future residents.

MM-GHG-2 Use Alternative Refrigerants Instead of High-GWP Refrigerants. Refrigerants with high global warming potential (GWP) shall be replaced with lower-GWP refrigerants (e.g., natural refrigerants such as carbon dioxide, ammonia, and hydrocarbons, or next-generation low-GWP synthetic refrigerants like hydrofluoroolefin-1234yf) in refrigeration and air conditioning equipment.

MM-GHG-3 Electric Vehicle Charging Infrastructure. Prior to the issuance of building permits, the project applicant or its designee shall provide evidence to the County of Imperial that the building design plans meet or exceed California Green Building Standards Code Tier 2 standards to encourage the use of electric vehicles.

MM-GHG-4 Sustainable Concrete Building Materials. This mitigation applies to industrial land uses only. The project shall be designed with sustainable materials that will reduce 35% of the overall carbon footprint compared to other traditionally designed concrete tilt buildings. The following measures shall be implemented:

- The future developments shall reduce overall concrete in the slab by 10% through the use of a steel fiber mix to increase the overall strength of the concrete to reduce concrete thickness.
- The future developments shall reduce overall concrete in the tilt walls by 30% by providing 4-inch foam insultation in the middle of the concrete panel (also known as composite panels). Whereas traditional concrete tilt walls have no R-value, the foam insulation will result in an R-value of R-19, thereby reducing overall energy consumption and increasing occupant comfort.
- The roof shall have a 10% reduction in steel because of the lighter concrete tilt walls due to the foam insulation.
- The future developments' specifications shall require the use of sustainable concrete to reduce the project's overall carbon footprint by 35%.

Level of Significance After Mitigation

The above mitigation measures would reduce GHG emissions associated with implementation of the LVSP. However, the effectiveness of all mitigation is not quantifiable, and the LVSP would still exceed the 3,000 MT CO_2e per year threshold in Phase 1 (2035), Phase 2 (2045), and Phase 3 (2055), resulting in a **significant and unavoidable impact**.

3.5.2 Would the project conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of greenhouse gases?

As discussed previously, the evaluation herein addresses the LVSP's potential to conflict with GHG reduction plans, namely (1) the CARB 2022 Scoping Plan, (2) SCAG's RTP/SCS, and (3) the ICRCAP.

Project Potential to Conflict with State Reduction Targets and the California Air Resources Board's 2022 Scoping Plan

As discussed above, the California State Legislature passed AB 32 to provide initial direction and initiate the state's long-range climate objectives. Since the passage of AB 32, the state has adopted GHG emission reduction targets

for future years beyond the initial 2020 horizon year. CARB is required to develop the Scoping Plan, which provides the framework for actions to achieve the state's GHG emission reduction targets. The Scoping Plan is the official framework for the measures and regulations that will be implemented to reduce California's GHG emissions in alignment with the state's adopted GHG reduction targets. Therefore, a project would be found to not conflict with the state's climate goals set forth in statutes and regulations if it would meet the Scoping Plan policies and would not impede attainment of the goals therein.

The Second Update included measures to promote renewable energy and energy efficiency (including the mandates of SB 350) and to increase stringency of the LCFS, measures identified in the Mobile Source and Freight Strategies and in the proposed Short-Lived Climate Pollutant Plan, and measures to increase the stringency of SB 375 targets. The 2022 Scoping Plan builds upon and accelerates programs currently in place, including moving to zero-emission transportation; phasing out the use of natural gas for heating homes and buildings; reducing chemical and refrigerants with high GWP; providing communities with sustainable options for walking, biking, and public transit; and displacing fossil-fuel-fired electrical generation through use of renewable energy alternatives (e.g., solar arrays and wind turbines) (CARB 2022). Implementation of the measures and programs included in the 2022 Scoping Plan are largely the responsibility of policymakers and would result in the reduction of project-related GHG emissions with no action required at the project level.

As discussed previously, the 2045 carbon neutrality goal required CARB to expand proposed actions in the 2022 Scoping Plan to include those that capture and store carbon in addition to those that reduce only anthropogenic sources of GHG emissions. The project would support the state's carbon neutrality goals, as implementation includes the addition of urban tree and native plantings throughout the project site; these plantings represent opportunities for potential carbon removal and sequestration over the project lifetime. However, the 2022 Scoping Plan emphasizes that reliance on carbon sequestration in the state's natural and working lands will not be sufficient to address residual GHG emissions, and achieving carbon neutrality will require the research, development, and deployment of additional methods to capture atmospheric GHG emissions (e.g., mechanical direct air capture) (CARB 2022). Given that the specific path to neutrality will require the development of technologies and programs that are not currently known or available, the project's role in supporting the statewide goal would be speculative and cannot be wholly identified at this time.

The CARB 2022 Scoping Plan includes the Scoping Plan Scenario, which serves as a framework in guiding policies and actions to reduce GHG emissions to keep California on track to achieve the SB 32 GHG reduction target for 2030 and become carbon neutral no later than 2045. The Scoping Plan Scenario provides a more drastic reduction of GHG emissions compared to the Reference Scenario identified within the Second Update. Table 2-1 of the 2022 Scoping Plan lists implementable actions to achieve the reductions in the Scoping Plan Scenario. The measurable actions are categorized by AB 32 GHG inventory sectors and are accompanied by statutes and EOs that work to achieve the same or similar goals (CARB 2022). The actions identified in Table 2-1 of the 2022 Scoping Plan that are relevant to the scope of the project are listed below in Table 3-11, along with the project's consistency with each action.

Table 3-11 evaluates the LVSP's potential to conflict with the measures from the CARB 2022 Scoping Plan that are relevant and applicable to the LVSP.

Table 3-11. Project Potential to Conflict with the California Air Resources Board 2022 Scoping Plan

Sector	Action	Potential to Conflict
GHG Emissions Reductions Relative to the SB 32 Target	40% below 1990 levels by 2030	***No conflict.*** Although the SB 32 GHG emissions reduction target is not an Action that is analyzed independently, it is included in Table 2-1 of the 2022 Scoping Plan for reference. The LVSP is not expected to obstruct or interfere with agency efforts to meet the SB 32 reduction goal; As discussed under GHG-a,t he LVSP includes local sources of lithium and development of solar and geothermal facilities, which are an important baseload component for achieving the State's Renewable Portfolio goals.
Smart Growth/VMT	VMT per capita reduced 25% below 2019 levels by 2030, and 30% below 2019 levels by 2045	***Partial Inconsistency.*** The project's VMT impacts are significant and unavoidable. Therefore, the development of the LVSP would potentially obstruct or interfere with agency efforts to meet this regional VMT reduction goal, including through implementation of SB 375. Nonetheless, MM-TRA-1 through MM-TRA-4 would be implemented in the LVSP to enhance transit access and connectivity of the project within the County.
Light-Duty Vehicles Zero-Emission Vehicles	100% of LDV sales ZEV by 2035	***No conflict.*** As this action pertains to LDV sales within California, the project would not obstruct or interfere with its implementation. Furthermore, the LVSP would support the transition from fossil fuel LDV to ZEV through its development of EV charging stations as a primary land use; buildout of the LVSP would include over 18 acres of built EV charging station area, serving both passenger EVs and EV trucks.
Truck ZEVs	100% of MDV/ HDV sales ZEV by 2040	***No conflict.*** As this action pertains to MDV and HDV sales within California, the project would not obstruct or interfere with its implementation. Furthermore, the LVSP would support the transition from fossil fuel LDV to ZEV through its development of EV charging stations as a primary land use; buildout of the LVSP would include over 18 acres of built EV charging station area, serving both passenger EVs and EV trucks.

Table 3-11. Project Potential to Conflict with the California Air Resources Board 2022 Scoping Plan

Sector	Action	Potential to Conflict
Freight and Passenger Rail	100% of passenger and other locomotive sales ZEV by 2030 100% of line haul locomotive sales ZEV by 2035 Line haul and passenger rail rely primarily on hydrogen fuel cell technology, and others primarily use electricity.	***No conflict.*** As this action pertains to the sale of locomotives, the project would not obstruct or interfere with its implementation. The project would comply with CARB line haul locomotive regulations. As described in Policy CT-14 of the LVSP, sustainable freight transport modes would be promoted and regional economic competitiveness would be enhanced through efficient cross-border trade operations, realizing benefits such as reduced emissions. In addition, as described in Policy HP-13 of the LVSP, the County would continue to work with the Imperial County Transit Commission to offer zero-emission transportation methods throughout the North End of Imperial County.
Electricity Generation	Sector GHG target of 38 million metric tons of MMT CO_2e in 2030 and 30 MMT CO_2e in 2035 Retail sales load coverage[1] 20 gigawatts of offshore wind by 2045 Meet increased demand for electrification without new fossil gas-fired resources	***No conflict***. As this action pertains to the statewide procurement of renewable energy, the LVSP would not obstruct or interfere with its implementation. Furthermore, the LVSP's fundamental purpose is to provide a streamlined process for geothermal energy production and lithium extraction, processing, production, and manufacturing that will assist in the country's need to quickly transition to renewable energy. Additionally, the LVSP would include the development of renewable and clean energy-generating infrastructure, including geothermal, solar fields, BESS facilities, agrivoltaics, and floatovoltaics.
New Residential and Commercial Buildings	All-electric appliances beginning 2026 (residential) and 2029 (commercial), contributing to 6 million heat pumps installed statewide by 2030	***Potential conflict.*** The project would not require all-electric appliances in new residential and commercial buildings. Therefore, the LVSP would potentially obstruct or interfere with CARB's efforts to meet the all-electric appliance and heat pump goals.
Food Products	7.5% of energy demand electrified directly and/or indirectly by 2030; 75% by 2045	***No conflict.*** The LVSP does not include the development of food product manufacturing and would therefore not conflict with goals related to energy demand of food products. Furthermore, the LVSP would include renewable energy

Table 3-11. Project Potential to Conflict with the California Air Resources Board 2022 Scoping Plan

Sector	Action	Potential to Conflict
		generation (geothermal, solar), which supports the electrification of the gird.
Construction Equipment	25% of energy demand electrified by 2030; 75% electrified by 2045	***No conflict.*** As this action pertains to the electrification of off-road equipment across California, the project would not obstruct or interfere with its implementation. The LVSP HP-7 Program requires construction equipment with higher-tier engines and all operational off-road equipment to be outfitted with U.S. Environmental Protection Agency–rated Tier 4 Final engines. Moreover, Program HP-7 includes that electric-powered or zero-emission equipment is encouraged to be used when feasible.
Other Industrial Manufacturing	0% energy demand electrified by 2030; 50% by 2045	***No conflict.*** The project would not obstruct or interfere with CARB's efforts to meet 0% energy demand electrified by 2030 and 50% by 2045. As described in the LVSP and in Section 2.2.3.3, Program I-17 requires, where feasible, that the County shall supply municipal facilities with on-site renewable electricity. Policy LU-10 requires that solar photovoltaic systems would be installed with a generation capacity at least 25% greater than the minimum requirements established by the 2022 California Building Standards Code. Where feasible, alternative renewable energy sources (e.g., geothermal) would be implemented to supplement on-site solar energy production. Policy HP-9 requires that the use of 95% (on average) renewable energy in the mineral process would be mandated by 2040. Lastly, data centers must be powered on average by 30% or more from renewable energy sources, and carbon neutral by 2045.
Agriculture Energy Use	25% energy demand electrified by 2030; 75% by 2045	***No conflict.*** The LVSP would not obstruct or interfere with CARB's efforts to electrify energy demand related to agricultural production.
Low-Carbon Fuels for Transportation	Biomass supply used to produce conventional and advanced biofuels, as well as hydrogen	***No conflict***. The LVSP would not obstruct or interfere with CARB's efforts to increase the provision of low carbon fuels for transportation. The development and

Table 3-11. Project Potential to Conflict with the California Air Resources Board 2022 Scoping Plan

Sector	Action	Potential to Conflict
		use of biofuels in trucks and automobiles would occur at the state and regional level.
Low-Carbon Fuels for Buildings and Industry	In 2030s, biomethane blended in pipeline Renewable hydrogen blended in fossil gas pipeline at 7% energy (~20% by volume), ramping up between 2030 and 2040 In 2030s, dedicated hydrogen pipelines constructed to serve certain industrial clusters	***No conflict.*** The LVSP would not obstruct or interfere with CARB's efforts to increase the provision of low carbon fuels for use in buildings and industry. The blending of biomethane and use of renewable hydrogen in existing natural gas pipelines would happen at the scale of the utility provider and without action required by the project.
Noncombustion Methane Emissions	Increase landfill and dairy digester methane capture Some alternative manure management deployed for smaller dairies Moderate adoption of enteric strategies by 2030 Divert 75% of organic waste from landfills by 2025 Oil and gas fugitive methane emissions reduced by 50% by 2030 and further reductions as infrastructure components retire in line with reduced fossil gas demand	***No conflict.*** The LVSP would not obstruct or interfere with CARB's efforts to reduce noncombustion methane emissions. As described in Policy I-12 through Policy I-20 of the LVSP, various waste policies would ensure compliance with all regulations.
High-GWP Potential Emissions	Low-GWP refrigerants introduced as building electrification increases, mitigating HFC emissions	***No conflict.*** The LVSP would not obstruct or interfere with agency efforts to introduce low-GWP refrigerants. The State has established a prohibition on the sale or distribution of bulk HFCs identified as having a high GWP through SB 1206.
Natural and Working Lands	Conserve 30% of the state's natural and working lands and coastal waters by 2030. Implement near- and long-term actions to accelerate natural removal of carbon and build climate resilience in our forests, wetlands, urban greenspaces, agricultural soils, and land conservation activities in ways that serve all communities—and in particular low-income, disadvantaged, and vulnerable communities.	***Potential conflict.*** Because the LVSP would convert lands that are currently used for agriculture, it would potentially conflict with the 2022 Scoping Plan goal to conserve natural and working lands.

Table 3-11. Project Potential to Conflict with the California Air Resources Board 2022 Scoping Plan

Sector	Action	Potential to Conflict
Forests and Shrublands	At least 2.3 million acres treated statewide annually in forests, shrublands/chaparral, and grasslands, comprising regionally specific management strategies that include prescribed fire, thinning, harvesting, and other management actions. No land conversion of forests, shrublands/chaparral, or grasslands.	***No conflict.*** The Lithium Valley region does not include forests, shrublands, or grasslands and is characterized instead as an arid desert region, with a large portion currently used for agriculture. The LVSP would therefore not contribute to forest thinning or the conversion of shrublands or grasslands. Additionally, the LVSP would include the restoration and preservation of the natural ecosystems within the LVSP area, including the Salton Sea playas and river corridor.

Source: CARB 2022.
Note: SB = Senate Bill; GHG = greenhouse gas; LVSP = Lithium Valley Specific Plan; VMT = vehicle miles traveled; MM = Mitigation Measure; LDV = light-duty vehicles; ZEV = zero-emission vehicle; EV = electric vehicle; MDV = medium-duty vehicle; HDV = heavy-duty vehicle; CARB = California Air Resources Board; MMT CO_2e = million metric tons carbon dioxide equivalent; HFC = hydrofluorocarbon; Scoping Plan = 2022 Scoping Plan for Achieving Carbon Neutrality.

the LVSP would support the overarching goals of the 2022 Scoping Plan and the underlying statewide GHG reduction targets, including providing clean, renewable energy, including baseload or nonintermittent energy, to the grid through geothermal. The County acknowledges the partial inconsistency with VMT, electrification of new residential and commercial buildings and conversion of working lands goals. However, as discussed under Impact GHG-a, Global Comparison, the 2022 Scoping Plan highlights the significance of lithium batteries and the transition to zero-emission technologies to achieve state GHG reduction goals, explaining that "[d]ecarbonizing the electricity sector is a crucial pillar of this Scoping Plan. It depends on … replacing fossil-fueled generation with renewable and zero-carbon resources, including solar, wind, energy storage, geothermal, biomass, and hydroelectric power." However, to achieve these goals, "other resources such as storage and demand-side management are essential to maintain reliability with high concentrations of renewables." The 2022 Scoping Plan acknowledges the "integration of greater amounts of variable renewable generation resources is changing power system planning and operations, and system operators need resources with flexible attributes to balance shifting supply and demand." That discussion further notes the growing need for nonvariable renewable generation and expressly identifies "geothermal, biomass, and dam-based hydroelectric power" as assisting in evening out our variable renewable energy generation (CARB 2022). Buildout of the LVSP includes the development of 2,550 MW of geothermal power plants. The co-development of geothermal power facilities also improves electric grid stability, grid reliability, and grid resiliency because such facilities "provide a sustainable and stable source of electricity and are characterized as a baseload renewable resource"; such power facilities also "help to restart the grid" (Paz et al. 2022).

As such, although the project may conflict with some specific actions in the state's 2022 Scoping Plan, such as VMT reduction, due to the nature of the Plan Area location, the project would on the whole facilitate achieving other key statewide GHG reduction goals, such as decarbonizing our transportation and energy sectors. In fact, transportation electrification and building decarbonization are two of the three priority areas that CARB recommends local jurisdictions focus on for climate action as part of Appendix D of the 2022 Scoping Plan; the project would support these priority areas. For all the reasons discussed above, buildout of the LVSP would therefore not conflict with the overall goals of CARB's 2022 Scoping Plan.

Project Potential to Conflict with the Imperial County Regional Climate Action Plan

The LVSP's potential to conflict with the relevant measures identified within the ICRCAP is discussed in Table 3-12 below.

Table 3-12. Project Consistency with the Imperial County Regional Climate Action Plan

Measure		Project Potential to Conflict
Goal: Transportation		
T-1.2	Plan and implement a system of bicycle lanes and multi-use trails that link the cities, unincorporated communities, schools, commercial/retail, employment centers, health care service facilities, public transportation, and other points of interest.	***No conflict***. The LVSP would implement a bicycle circulation and transportation network that includes routes that take into consideration bicyclist safety. In addition, as described in LVSP Policy CT-13, the County would support the diversification of travel modes used in Lithium Valley to increase employee trips made by bicycle or public transit, including new mobility types like electric shuttles, electric vanpool/carpool, electric carsharing service, docked bikeshare, and e-scooter sharing to link communities. The designated bike routes would connect to commercial nodes and transportation hubs in the local area.
T-2.2	Synchronize traffic signals to reduce idling.	***No conflict.*** As described in the LVSP, the project would implement intelligent transportation systems and signalized intersections to optimize traffic flow and reduce congestion.
T-2.4	Work with the air district to establish an incentive program to trade in fossil fuel-powered landscaping equipment with electric versions.	***No conflict***. The LVSP would implement Mitigation Measure AQ-7, Landscape Maintenance Equipment Emission Reduction, which would require educational materials to be provided to future residents about the ICAPCD Lawn Equipment Exchange Program.
T-3.2	Install public electric vehicle (EV) charging stations.	***No conflict***. As described in the LVSP, the project would allow the development of EV charging stations as a primary use.
T-3.3	Require electric vehicle charging stations at new non-residential developments.	***No conflict***. As described in Policy HP-4, the project would facilitate the deployment of EV charging infrastructure through the collaboration with local organizations to identify the best locations, funding mechanisms, and maintenance plans for EV charging stations.
Goal: Energy		
E-1.3	Reduce or eliminate natural gas and propane consumption in new and existing residential buildings.	***No conflict***. The LVSP does not promote or incentivize natural gas. However, it is legally infeasible for the County to prohibit natural gas consumption (*California Restaurant Association v. City of Berkeley* [2023] 65 F.4th 1045).
E-2.3	Require large parking lots for new commercial development projects to include solar canopies to produce on-site renewable energy and provide shading for energy efficiency benefits.	***No conflict***. The LVSP would support the development of on-site solar, which is the installation and operation of solar energy production systems that provide renewable energy to other on-site industrial or commercial uses. On-site solar may be roof-mounted, installed over parking lots or carports, or an ancillary solar farm.

Table 3-12. Project Consistency with the Imperial County Regional Climate Action Plan

Measure		Project Potential to Conflict
E-2.6	Establish or join program to increase grid-supply renewable and zero-carbon electricity.	*No conflict*. The LVSP would support the development of microgrids and distributed energy systems, as well as the integration of renewable energy storage batteries into the grid.
Goal: Waste		
WS- 1.2	Promote alternative uses of agricultural and organic waste by promoting the construction of composting and anaerobic digestion facilities.	*No conflict*. The LVSP would allow the development of anaerobic digestion facilities as a primary use in the Plan Area. Furthermore, as described in Policy I-20, the LVSP would explore opportunities for converting nonrecyclable waste into energy through advanced technologies like anaerobic digestion or waste-to-energy facilities, contributing to renewable energy goals.
WS-1.3	Create waste diversion ordinances for construction projects.	*No conflict*. As described in Policy I-16, the LVSP would establish and monitor comprehensive waste diversion targets for construction through regular audit and transparent reporting to stakeholders.
Goal: Agriculture		
AG-1.1	Work with utilities and/or air districts to provide incentives such as CARB's FARMER program to convert stationary diesel- or gas-powered irrigation pumps to electric pumps that are connected to the grid or use off-grid alternative/renewable energy sources, such as solar.	*No conflict*. The LVSP supports the County's broader sustainability and electrification goals by facilitating the transition of agricultural lands to green industrial and clean energy infrastructure. Although the plan would reduce agricultural operations in the Plan Area, it would not preclude the implementation of incentive programs such as the California Air Resources Board's FARMER program, in other areas of the County.
AG-1.3	Provide incentives for replacing gas- or diesel-powered agricultural equipment with electric or alternatively fueled equivalents.	
AG-2.1	Consider various agricultural land and open space conservation strategies that allow developers to preserve lands and/or increase residential development density in smart growth infill areas by removing development potential of lands.	*No conflict*. Although the LVSP would support the development of existing agricultural lands within the Plan Area, by confining establishing a specific development zone, the LVSP includes the implementation of specific conservation areas and designed open spaces to protect areas of environmental, cultural, and tribal significance and promote retaining areas for restoration and mitigation projects. Furthermore, the LVSP facilitates smart growth in the region by creating jobs in proximity to disadvantaged communities, thereby reducing the need for long-distance commuting and enabling future opportunities for housing in nearby urbanized areas.
AG-2.2	Target stream restoration programs and riparian restoration strategies for carbon sequestration, natural heat relief, water quality improvements, and/or wildlife habitat mitigation.	*No conflict*. As described in the LU-3 Program, the LVSP would target restoration programs and riparian restoration strategies for carbon sequestration, natural heat relief, water quality improvements, and/or wildlife habitat mitigation.

Table 3-12. Project Consistency with the Imperial County Regional Climate Action Plan

Measure		Project Potential to Conflict
AG-2.4	Develop and enforce landscape tree requirement for new developments.	*No conflict*. As described in the LVSP, the LVSP would develop and enforce landscape tree requirements based on the land use designation, including landscaping of medians, parkways, and parking lots, and revegetation of salt-tolerant trees in the playa zones.

Source: Imperial County Transportation Commission 2021.

Note: LVSP = Lithium Valley Specific Plan; County = County of Imperial; ICAPCD = Imperial County Air Pollution Control District; EV = electric vehicle; Plan Area = Specific Plan Area.

As discussed in Table 3-12 above, the LVSP would not conflict with the ICRCAP. The LVSP would support, as feasible, the measures and overarching goals therein to address the impacts of climate change and reduce GHG emissions in the region. Therefore, impacts would be less than significant.

Conclusion

Based on the above considerations, the LVSP would not conflict with the overall goals within the CARB 2022 Scoping Plan or the ICRCAP. This impact would be **less than significant**.

Level of Significance Before Mitigation

This impact would be less than significant.

Mitigation Measures

No mitigation is required.

Level of Significance After Mitigation

Impacts would be **less than significant** without mitigation.

INTENTIONALLY LEFT BLANK

4 Energy

4.1 Environmental Setting

4.1.1 Electricity

According to the U.S. Energy Information Administration, California used approximately 239,480,452 MWh of electricity in 2023 (EIA 2024b). Electricity usage in California for different land uses varies substantially by the types of uses in a building, type of construction materials used in a building, and the efficiency of all electricity-consuming devices within a building. Due to the state's energy efficiency building standards and efficiency and conservation programs, California's electricity use per capita in the residential sector is lower than any other state except Hawai'i (EIA 2024c).

IID would provide electricity to the LVSP. IID is a public power utility, providing electricity to its service area, which covers 6,471 square miles, including all of Imperial County along with parts of Riverside and San Diego counties (IID 2025a). According to the 2024 IID Power Content Label, renewable energy sources account for 27% of IID's overall energy resources (IID 2025b). In 2023, IID's total electricity sales were 3,403,891 MWh (CEC 2025a). By 2040, the CEC forecasts that IID's total electricity sales will be 4,582,000 MWh, which is the latest year that forecasts are available (CEC 2024b).

4.1.2 Natural Gas

According to the U.S. Energy Information Administration, California used approximately 2,087 billion cubic feet of natural gas in 2023 (EIA 2025a). The majority of California's natural gas customers are residential and small commercial customers (core customers). These customers account for approximately 35% of the natural gas delivered by California utilities (CPUC 2025). Large consumers, such as electric generators and industrial customers (noncore customers), account for approximately 65% of the natural gas delivered by California utilities (CPUC 2025). CPUC regulates California natural gas rates and natural gas services, including in-state transportation over transmission and distribution pipeline systems, storage, procurement, metering, and billing. Most of the natural gas used in California comes from out-of-state natural gas basins. Consistent with SB 1440 [2018] and CPUC Decision 22002-025, the Southern California Gas Company (SoCalGas) began providing renewable gas into their pipeline systems in 2019 (SoCalGas 2025).

SoCalGas provides Imperial County with natural gas service. SoCalGas's service territory encompasses approximately 20,000 square miles and more than 500 communities. SoCalGas's 2024 California Gas Report projects total cumulative gas demand to decline at an annual rate of 0.7% from 2024 to 2040 (California Gas and Electric Utilities 2024). The total capacity of natural gas available to SoCalGas in 2024 is estimated to be 3.8 billion cubic feet per day. In 2040, the total capacity available is also estimated to be 3.8 billion cubic feet per day[26] (California Gas and Electric Utilities 2024). This amount is approximately equivalent to 3.88 billion thousand British thermal units (kBTU) per day or 38.8 million therms per day. In 2022, SoCalGas delivered approximately 41 million therms (4.1 billion kBTU) to Imperial County (CEC 2025b). By 2040, SoCalGas forecasts that its natural gas capacity

[26] One cubic foot of natural gas has approximately 1,020 British thermal units (BTU) of natural gas or 1.02 thousand British thermal units (kBTU) of natural gas.

will be 3,775 million cubic feet per day, or 1,415 trillion kBTU per year, which is the latest year that forecasts are available (California Gas and Electric Utilities 2024).

4.1.3 Petroleum

According to the U.S. Energy Information Administration, California used approximately 648 million barrels, or 27.2 billion gallons, of petroleum in 2023, with the majority (555 million barrels) used for the transportation sector (EIA 2025b). There are 42 U.S. gallons in a barrel, so this equates to a total daily use of approximately 27.2 billion gallons of petroleum among all sectors and 23.3 billion gallons for the transportation sector. In California, petroleum fuels refined from crude oil are the dominant source of energy for transportation sources. Petroleum usage in California includes petroleum products such as motor gasoline, distillate fuel, liquefied petroleum gases, and jet fuel. California has implemented policies to improve vehicle efficiency and to support use of alternative transportation, which are described in Section 3.2.2.

4.2 Regulatory Setting

4.2.1 Federal Regulations

Federal Energy Policy and Conservation Act

In 1975, Congress enacted the Federal Energy Policy and Conservation Act, which established the first fuel economy standards for on-road motor vehicles in the United States. Pursuant to the act, the NHTSA is responsible for establishing additional vehicle standards. In 2012, new fuel economy standards for passenger cars and light trucks were approved for model years 2017 through 2021 (77 FR 62624–63200). Fuel economy is determined based on each manufacturer's average fuel economy for the fleet of vehicles available for sale in the United States.

Energy Policy Act of 2005

In January 2005, the Energy Policy Act was signed into law. It addresses energy production in the United States, including energy efficiency, renewable energy, oil and gas, coal, tribal energy, nuclear matters and security, vehicles, and motor fuels, including ethanol, hydrogen, electricity, energy tax incentives, hydropower and geothermal energy, and climate change technology. The Energy Policy Act provides loan guarantees for entities that develop or use innovative technologies that avoid the by-production of GHGs. Another provision of the Energy Policy Act is the RFS, which increases the amount of biofuel that must be mixed with gasoline sold in the United States.

Energy Independence and Security Act of 2007

On December 19, 2007, the EISA was signed into law (EPA 2007). In addition to setting increased Corporate Average Fuel Economy standards for motor vehicles, the EISA includes the following other provisions related to energy efficiency:

- RFS (Section 202)
- Appliance and lighting efficiency standards (Sections 301–325)
- Building energy efficiency (Sections 411–441)

This federal legislation (the RFS) requires ever-increasing levels of renewable fuels to replace petroleum (EPA 2022). The EPA is responsible for developing and implementing regulations to ensure that transportation fuel sold in the United States contains a minimum volume of renewable fuel. RFS program regulations were developed in collaboration with refiners, renewable fuel producers, and many other stakeholders.

The RFS program was created under the Energy Policy Act of 2005 and established the first renewable fuel volume mandate in the United States. As required under the act, the original RFS program (RFS1) required 7.5 billion gallons of renewable fuel to be blended into gasoline by 2012. Under the EISA, the RFS program was expanded in several key ways that laid the foundation for achieving significant reductions of GHG emissions through the use of renewable fuels, for reducing imported petroleum, and for encouraging the development and expansion of our nation's renewable fuels sector. The updated program ("RFS2") includes the following:

- EISA expanded the RFS program to include diesel, in addition to gasoline.
- EISA increased the volume of renewable fuel required to be blended into transportation fuel from 9 billion gallons in 2008 to 36 billion gallons by 2022.
- EISA established new categories of renewable fuel and set separate volume requirements for each one.
- EISA required the EPA to apply life-cycle GHG performance threshold standards to ensure that each category of renewable fuel emits fewer GHGs than the petroleum fuel it replaces.

Additional provisions of the EISA address energy savings in government and public institutions, promoting research for alternative energy, additional research in carbon capture, international energy programs, and the creation of "green jobs."

Transportation Equity Act for the 21st Century

The Transportation Equity Act for the 21st Century was signed into law in 1998 and builds on the initiatives established in the 1991 Intermodal Surface Transportation Efficiency Act (ISTEA) legislation. The Transportation Equity Act authorizes highway, highway safety, transit, and other efficient surface transportation programs. The act continues the program structure established for highways and transit under ISTEA, such as flexibility in the use of funds, emphasis on measures to improve the environment, and focus on a strong planning process as the foundation of transportation decisions. The Transportation Equity Act also provides for investment in research and its application to maximize the performance of the transportation system through, for example, deployment of intelligent transportation systems to help improve operations and management of transportation systems and vehicle safety.

Infrastructure Investment and Jobs Act

The Infrastructure Investment and Jobs Act (Infrastructure Deal) was signed into law November 15, 2021. The legislation includes $39 billion of new investment to modernize transit, in addition to continuing the existing transit programs for 5 years as part of surface transportation reauthorization. The Infrastructure Deal would also invest $7.5 billion to build out a national network of EV chargers. The Infrastructure Deal would provide funding for deployment of EV chargers along highway corridors to facilitate long-distance travel and within communities to provide convenient charging where people live, work, and shop to support a goal of building a nationwide network of 500,000 EV chargers. This would accelerate the adoption of EVs, which would help reduce emissions and improve air quality. In addition, the Infrastructure Deal would include more than $65 billion of investments in clean

energy transmission including upgrading existing power infrastructure through expanding transmission lines to facilitate the expansion of renewables and clean energy.

The Inflation Reduction Act of 2022

The Inflation Reduction Act was signed into law by President Biden in August 2022. The act includes specific investment in energy and climate reform and is projected to reduce GHG emissions within the U.S. by 40% as compared to 2005 levels by 2030. The act allocates funds to boost renewable energy infrastructure (e.g., solar panels and wind turbines), includes tax credits for the purchase of EVs, and includes measures that will make homes more energy efficient. However, portions of the Inflation Reduction Act were rescinded in the One Big Beautiful Bill Act of 2025 (Public Law No 119-21).

Energy Policy and Conservation Act (Natural Gas Regulations)

The Energy Policy and Conservation Act, 42 USC Section 6297(c), expressly preempts State and local regulations concerning the energy use of many natural gas appliances. (*California Restaurant Association v. City of Berkeley* (2023) 65 F.4th 1045.) The LVSP does not promote or incentivize natural gas. However, it is legally infeasible for the County to prohibit natural gas consumption.

4.2.2 State Regulations

Warren–Alquist Act

The California Legislature passed the Warren–Alquist Act in 1974, which created the CEC. The legislation also incorporated the following three key provisions designed to address the demand side of the energy equation:

- It directed CEC to formulate and adopt the nation's first energy conservation standards for both buildings constructed and appliances sold in California.
- The act removed the responsibility of electricity demand forecasting from the utilities, which had a financial interest in high-demand projections, and transferred it to a more impartial CEC.
- CEC was directed to embark on an ambitious research and development program, with a particular focus on fostering what were characterized as nonconventional energy sources.

State of California Energy Action Plan

CEC and CPUC approved the first State of California Energy Action Plan in 2003. The plan established shared goals and specific actions to ensure the provision of adequate, reliable, and reasonably priced electrical power and natural gas supplies; it also identified cost-effective and environmentally sound energy policies, strategies, and actions for California's consumers and taxpayers. In 2005, CEC and CPUC adopted a second Energy Action Plan to reflect various policy changes and actions of the prior 2 years.

At the beginning of 2008, CEC and CPUC determined that it was not necessary or productive to prepare a new Energy Action Plan. This determination was based, in part, on a finding that the state's energy policies have been significantly influenced by the passage of AB 32, the California Global Warming Solutions Act of 2006 (discussed below). Rather than produce a new Energy Action Plan, CEC and CPUC prepared an "update" that examines the state's ongoing actions in the context of global climate change.

Construction Equipment Fuel Efficiency

EPA sets emission standards for construction equipment. The first federal standards (Tier 1) were adopted in 1994 for all off-road engines over 50 horsepower and were phased in by 2000. A new standard was adopted in 1998 that introduced Tier 1 for all equipment below 50 horsepower and established the Tier 2 and Tier 3 standards. The Tier 2 and Tier 3 standards were phased in by 2008 for all equipment. The current iteration of emissions standards for construction equipment are the Tier 4 efficiency requirements are contained in 40 Code of Federal Regulations Parts 1039, 1065, and 1068 (originally adopted in 69 Federal Register 38958 [June 29, 2004], and most recently updated in 2014 [79 Federal Register 46356]). Emissions requirements for new off-road Tier 4 vehicles were completely phased in by the end of 2015.

CARB is also charged with developing air pollution control regulations based upon the best available control measures and implementing every feasible control measure under the state and federal Clean Air Act (Health and Safety Code Sections 39602.5, 39667, 43013, subds. [a] and [h], 43018, 40600, 40601, 40612 [a][2] and [c][1][A]). Pursuant to these directives, stringent emission standards were adopted in 2004 for off-road construction equipment (i.e., Tier 4 standards) (40 Code of Federal Regulations Parts 1039, 1065, and 1068; 13 CCR Section 2025; AR 2854). CARB also adopted emission standards for on-road heavy-duty diesel vehicles (i.e., haul trucks). (13 CCR Section 1956.8.) These haul truck regulations mandate fleet turnover to ensure that by January 1, 2023, nearly all on-road diesel trucks will have 2010 model year engines or equivalent [i.e., Tier 4]. In addition, interim steps are incorporated into the regulations (e.g., vehicles older than 1999 will be replaced with newer engines by 2020).

Assembly Bill 1007

AB 1007 (2005) required CEC to prepare a statewide plan to increase the use of alternative fuels in California (State Alternative Fuels Plan). CEC prepared the plan in partnership with CARB and in consultation with other state agencies, plus federal and local agencies. The State Alternative Fuels Plan assessed various alternative fuels and developed fuel portfolios to meet California's goals to reduce petroleum consumption, increase alternative fuels use, reduce GHG emissions, and increase in-state production of biofuels without causing a significant degradation of public health and environmental quality.

Other Applicable Regulations

Other applicable regulations include the following, which are discussed in Section 3.2.3, State Regulations:

- California Building Standards (Title 24, CALGreen)
- AB 32, SB 32, AB 1279 (the state's GHG emission reduction planning framework creates co-benefits for energy-related resources)
- SB 1078, SB 107, SB 350, SB 100, SB 1020 (Renewable Energy Sources)
- SB 1368
- AB 1493 and EO B-16-12
- EO S-1-07
- SB 375

- Advanced Clean Cars Program
- Advanced Clean Trucks Program
  - Truck and Bus Regulation, On-Road Heavy-Duty Diesel Vehicles (In-use) Regulation

4.2.3 Local Regulations

4.2.3.1 County of Imperial

Southern California Association of Governments

As noted above, California's 18 MPOs have been tasked with creating SCSs in an effort to reduce the region's VMT to help meet AB 32 targets through integrated transportation, land use, housing, and environmental planning. Pursuant to SB 375, CARB set per capita GHG emission reduction targets from passenger vehicles for each of the state's 18 MPOs. For SCAG, the state's initial mandated reductions were set at 8% by 2020 and 13% by 2035. In March 2018, CARB updated the SB 375 targets for SCAG to require 8% reduction by 2020 and a 19% reduction by 2035 in per capita passenger vehicle GHG emissions.

Pursuant to Government Code Section 65080(b)(2)(B), the SCS must "set forth forecasted development pattern for the region which when integrated with the transportation network, and other transportation measures and policies, will reduce the GHG emissions from automobiles and light trucks to achieve the GHG reduction targets." To that end, SCAG has developed Connect SoCal, the 2024–2050 RTP/SCS, which complies with CARB's updated emissions reduction targets and meets the requirements of SB 375 by achieving per capita GHG emission reductions relative to 2005 of 8% by 2020 and 19% by 2035 (SCAG 2024). The 2024–2050 RTP/SCS is a long-range visioning plan that balances future mobility and housing needs with economic, environmental, and public health goals, and charts a path toward a more mobile, sustainable, and prosperous region by making connections between transportation networks, between planning strategies, and between the people whose collaboration can improve the quality of life for Southern Californians. Connect SoCal embodies a collective vision for the region's future and is developed with input from local governments, county transportation commissions, tribal governments, nonprofit organizations, businesses, and local stakeholders within the counties of Imperial, Los Angeles, Orange, Riverside, San Bernardino, and Ventura.

The 2024–2050 RTP/SCS states goals (1) Mobility: Build and maintain a robust transportation network; (2) Communities: Develop, connect and sustain communities that are livable and thriving; (3) Environment: Create a healthy region for the people of today and tomorrow; and (4) Economy: support a sustainable, efficient, and productive regional economic environment that provides opportunities for all residents. The RTP acknowledges that "New and emerging technologies have had a significant impact on the transportation sector, transforming various aspects of mobility, efficiency, safety and user experience. These technologies include advancements in vehicle technology, like electric vehicles" and "how zero-emission vehicles can strengthen resilience through vehicle-to-grid technologies or other opportunities where batteries can be used to enhance capacity of renewable energy sources." The "Plan also strives to achieve broader regional objectives, such as increased housing production, improved equity and resilience, the preservation of natural lands, improvement of public health, increased transportation safety, support for the region's vital goods movement industries and more efficient use of resources."

SCAG also adopted Resolution No. 23-653-1, which emphasizes the need for projects and strategies that ensure a safe, resilient, and efficient supply chain and goods movement system. The resolution also highlights that, due to

the volume of trade in the SCAG region, which is home to the largest port complex in the country, the SCAG [must] develop strategies to accommodate growing freight movement" (SCAG 2023).

Imperial County General Plan

The Renewable Energy and Transmission Element of the City's General Plan works to implement development policies for geothermal and other renewable energy land uses in Imperial County. The relevant goals and policies from the Energy and Transmission Element are the following:

Goal 1: Support the safe and orderly development of renewable energy while providing for the protection of environmental resources.

Objective 1.5: Require appropriate mitigation and monitoring for environmental issues associated with developing renewable energy facilities. Draft Renewable Energy and Transmission Element Page 25 (Revised October 6, 2015)

Objective 1.6: Encourage the efficient use of water resources required in the operation of renewable energy generation facilities.

Objective 1.7: Assure that development of renewable energy facilities and transmission lines comply with Imperial County Air Pollution Control District's regulations and mitigation measures

Goal 3: Support development of renewable energy resources that will contribute to and enhance the economic vitality of Imperial County.

Objective 1.5: Require appropriate mitigation and monitoring for environmental issues associated with developing renewable energy facilities. Draft Renewable Energy and Transmission Element Page 25 (Revised October 6, 2015)

Objective 1.6: Encourage the efficient use of water resources required in the operation of renewable energy generation facilities. Objective 1.7: Assure that development of renewable energy facilities and transmission lines comply with Imperial County Air Pollution Control District's regulations and mitigation measures

Goal 4: Support development of renewable energy resources that will contribute to the restoration efforts of the Salton Sea.

Objective 4.1: Prioritize the Salton Sea exposed seabed (playa) for renewable energy development.

Goal 5: Encourage development of innovative renewable energy technologies that will diversify Imperial County's energy portfolio.

Objective 5.1: Support the implementation of pilot projects intended to test or demonstrate new and innovative renewable energy production technologies.

Objective 5.2: Encourage development of utility-scale distributed generation projects in the County.

Imperial County Regional Climate Action Plan

Adopted in June 2021, the ICRCAP serves both the ICTC and SCAG to address climate change and guide the regional efforts to reduce GHG emissions. The ICRCAP includes both emissions inventories for various jurisdictions in the Imperial Valley and identifies energy-related measures that would be implemented at the regional level to address GHG emissions and climate change, and therefore, energy. See Section 3.3.3.1 for a detailed discussion on the ICRCAP.

4.3 Significance Criteria and Methodology

4.3.1 Thresholds of Significance

The significance criteria used to evaluate the project impacts to energy are based on Appendix G of the CEQA Guidelines. According to CEQA Guidelines Appendix G, a significant impact related to energy would occur if the project would:

1. Result in potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy resources, during project construction or operation.

The project's potential to conflict with or obstruct a state or local plan for renewable energy or energy efficiency is analyzed in Section 2.4 and Section 3.5 and is therefore not analyzed herein.

4.3.2 Approach and Methodology

LVSP Measures

The LVSP would implement policies, programs, and existing regulations that reduce criteria air pollutant emissions, GHG emissions, and VMT, thereby achieving direct or indirect energy co-benefits. See Section 4.3, Air Quality; Section 4.8, Greenhouse Gas Emissions; and Section 4.17, Transportation, for the full list of policies, programs, and existing regulations. The following policies and existing regulations are relevant to the project's energy analysis:

- **Program HP-7:** Use of Tier 4 Final Off-Road Equipment for Construction and Operations
- **Policy CT-19:** Increased Bus Frequencies
- **Policy CT-20:** Dedicated Bus Lane on SR-111
- **Policy CT-21** Transit Hubs
- **Policy CT-22:** Express Bus Connections
- **Policy CT-23:** Employee Shuttle
- **Policy CT-24:** Construction Traffic Management Plan

4.3.2.1 Construction Energy

Construction of the LVSP would result in energy consumption primarily associated with the use of off-road construction equipment, on-site hauling and vendor (material delivery) trucks, and worker vehicles. All details for construction criteria air pollutants discussed in the Construction Scenario Assumptions subsection are also applicable for the estimation of construction-related energy consumption. As such, see he Construction Scenario Assumptions subsection for a

discussion of construction calculation methodology and assumptions used in the energy analysis. In addition, the following methodology was used to estimate construction electricity and petroleum consumption.

Electricity

Although electrical service would be established to serve construction, the amount of electricity that would be used is likely to be small relative to the operational demand of the project. Over the course of construction of the LVSP, the amount of electrical off-road equipment is anticipated to increase; however, to provide a conservative estimate of GHG and pollutant emissions, off-road equipment was largely assumed to be diesel powered. Temporary electric power for as-necessary lighting and electronic equipment, such as computers inside temporary construction trailers, would be provided by IID.

Natural Gas

Natural gas is not anticipated to be required during construction of the LVSP. Fuels used for construction would primarily consist of diesel and gasoline, which are discussed below under the Petroleum subsection.

Petroleum

Potential LVSP construction petroleum consumption was assessed through projected vehicle trip generation and off-road equipment used, as provided by the CalEEMod and CARB EMFAC2021 outputs in the criteria air pollutant and GHG emissions calculations (Appendix A). Fuel consumption from construction equipment was estimated by converting the total CO_2 emissions from each construction phase to gallons using conversion factors for CO_2 to gallons of gasoline or diesel. The conversion factor for gasoline is 8.78 kilograms per MT of CO_2 per gallon, and the conversion factor for diesel is 10.21 kilograms per MT of CO_2 per gallon (The Climate Registry 2025). Heavy-duty construction equipment associated with construction activities and vendor trucks was assumed to use diesel fuel. It was assumed that construction workers would travel to and from the project's construction sites in gasoline-powered vehicles. Fuel consumption from worker and vendor trips was estimated by converting the total CO_2 emissions from the construction phase to gallons using the conversion factors for CO_2 to gallons of gasoline or diesel.

4.3.2.2 Operational Energy

Energy consumption related to LVSP operations would include electricity use for building operations, water demand, wastewater treatment, and off-road equipment; natural gas consumption for heating; and petroleum consumption for stationary sources, motor vehicle travel, and rail travel. As previously discussed, three operational scenarios were modeled, consistent with land use development buildout information. Total buildout of the LVSP was assumed to be in 2055, with interim operational scenario years 2035 and 2045 also assessed. Operational energy consumption is based on the operational GHG emission calculations found in Appendix B. All details for construction criteria air pollutants discussed in the Operational Emission Source Assumptions subsection are also applicable for the estimation of construction-related energy consumption. As such, see Operational Emission Source Assumptions for a discussion of operational calculations methodology and assumptions used in the energy analysis.

Electricity and Natural Gas

Operation of the LVSP would require electricity for multiple purposes, including, but not limited to, building heating, cooling, lighting; and appliances, including refrigeration, electronics, including EV charging, equipment, and

machinery. Electricity would also be consumed during operation of the project related to water usage and solid waste disposal.

The estimation of operational electricity and natural gas consumption was based on CalEEMod land use defaults and units or total area (i.e., square footage) of the LVSP land uses. The electricity and natural gas use from residential land uses is calculated in CalEEMod based on the Residential Appliance Saturation Study. For nonresidential buildings, CalEEMod energy intensity value (electricity or natural gas usage per square foot per year) assumptions were based on the California Commercial End-Use Survey database. In addition, the energy associated with parking lots for each land use was assumed to be fully electric, with no natural gas usage, using CalEEMod defaults. It was assumed that certain land uses would use alternative electricity and natural gas assumptions, as described in the Operational Emission Source Assumptions subsection.

Petroleum

Petroleum would be consumed by vehicles throughout the Plan Area for LVSP operations. Such consumption is a function of total VMT and estimated vehicle fuel economies for the vehicles traveling within the Plan Area. With respect to estimated VMT from CalEEMod and based on the trip frequency and trip length methodologies cited in Section 2.3.2.2, Phase 1 would generate an estimated 523,719,580 annual VMT in 2035, Phase 2 would generate an estimated 943,402,054 annual VMT in 2045, and buildout of the LVSP would generate an estimated 1,139,911,995 annual VMT.

Similar to construction worker and vendor trips, fuel consumption was estimated by converting the total CO_2 emissions from mobile sources to gallons using the conversion factors for CO_2 to gallons of gasoline or diesel. Based on the annual fleet mix provided in CT-EMFAC2021 for Imperial County, for Phase 1, approximately 84% of the fleet mix was assumed to run on gasoline, and approximately 16% of the fleet mix was assumed to use diesel. For Phase 2, approximately 80% of the fleet mix was assumed to run on gasoline, and approximately 20% of the fleet mix was assumed to use diesel. For buildout of the LVSP, approximately 77% of the fleet mix was assumed to run on gasoline, and approximately 23% of the fleet mix was assumed to use diesel. Although a portion of vehicles accessing the site are anticipated to be plug-in hybrid EVs or battery EVs, all vehicles were conservatively assumed to consume petroleum for the energy analysis

In addition, petroleum, specifically diesel, would be consumed by LVSP-generated rail transport and stationary sources, such as emergency generators and fire pumps. Fuel consumption from rail line haul and stationary sources was estimated by converting the total CO_2 emissions from project rail and stationary sources to gallons using the conversion factor for diesel.

Renewable Energy Potential

Implementation of the LVSP would include the development of commercial-scale renewable-energy-generating facilities, such as PV solar power systems installed at traditional solar field sites, integrated with agriculture operations (agrivoltaics), and deployed on bodies of water (floatovoltaics). The total amount of potential renewable energy from solar uses was calculated based on an average estimated number of 6 acres per MW generated per facility, operating 8,760 hours per year.

Furthermore, implementation of the LVSP would include the development of 17 geothermal power generating facilities at buildout. In calculating the potential geothermal energy production, it was assumed that each facility would have a capacity of 150 MW and would be operational 8,760 hours per year.

Lastly, solar power generation would be incorporated into the project sites through the installation of rooftop solar panels on residential and nonresidential buildings, as discussed above under California Code of Regulations, Title 24, Part 6. However, due to the absence of detailed information regarding specific building locations and available rooftop area, the potential electricity generation from rooftop solar installations was not quantified in the energy analysis.

4.4 Impacts Analysis

4.4.1 Would the project result in potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy resources, during Project construction or operation?

The development facilitated by the LVSP's consumption of energy resources during construction and operation is evaluated in detail below.

Construction

Electricity

During construction, as-necessary lighting, the conveyance of water used to control fugitive dust, and electronic equipment, such as computers inside temporary construction trailers, would require electricity to be provided by IID. The electricity demand at any given time would vary throughout the construction period based on the construction activities being performed and would cease upon completion of construction. When not in use, electrical equipment would be powered off so as to avoid unnecessary energy consumption. The electricity used for project construction activities would be temporary and minimal. The minimal construction electricity needs would be within the supply and infrastructure service capabilities of IID, and it would not require additional capacity. Furthermore, construction of the project would not impact energy resources.

Natural Gas

Construction activities typically do not involve the consumption of natural gas. Accordingly, natural gas would not be expected to be supplied to support project construction activities. Natural gas is not anticipated to be required during construction of the LVSP. Fuels used for construction would primarily consist of diesel and gasoline, which are discussed under the subsection Petroleum, below. Any minor amounts of natural gas that may be consumed as a result of LVSP construction would be temporary and negligible and would not have an adverse effect.

Petroleum

The project would consume petroleum during construction associated with the use of off-road equipment and vehicles (worker vehicles, delivery trucks, and haul trucks). The estimated diesel fuel usage from construction is shown in Table 4-1. See Energy Calculations in Appendix F, Operational Health Risk Assessment, for details.

Table 4-1. Total Construction Petroleum Demand

Construction Phase	Off-Road Equipment (diesel)	Haul Trucks (diesel)	Vendor Trucks (diesel)	Worker Vehicles (gasoline)	Total
Gallons					
Phase 1 (2025–2034)	28,533,408	1,017,890	8,605,796	14,722,386	52,879,480
Phase 2 (2035–2044)	8,627,559	386,192	3,624,729	6,201,543	18,840,024
Phase 3 (2045–2054)	7,572,068	252,388	2,983,646	5,095,276	15,903,377
				Total	**87,622,881**

Source: Appendix F, Energy Calculations.

In summary, construction associated with the development of the LVSP is estimated to consume a total of approximately 61,603,676 gallons of diesel and 26,019,205 gallons of gasoline, for a total of 87,622,881 gallons of petroleum. Construction as implemented by the LVSP would include individual construction projects, each of which would represent single events and would not require the ongoing or permanent commitment of petroleum resource for this purpose.[27]

Notably, the construction activity associated with the development of the LVSP would be subject to CARB's In-Use Off-Road Diesel Vehicle Regulation, which applies to certain off-road diesel engines, vehicles, or equipment greater than 25 horsepower. The regulation (1) imposes limits on idling, requires a written idling policy, and requires a disclosure when selling vehicles; (2) requires all vehicles to be reported to CARB (using the Diesel Off-Road Online Reporting System) and labeled; (3) restricts the adding of older vehicles into fleets starting on January 1, 2014; and (4) requires fleets to reduce their emissions by retiring, replacing, or repowering older engines or by installing verified diesel emission control strategies (i.e., exhaust retrofits). The fleet must either show that its fleet average index was less than or equal to the calculated fleet average target rate or that the fleet has met the Best Achievable Control Technology requirements.

Overall, given the temporary nature of the fuel demand, the relatively small proportion of total state consumption involved, and the adherence to efficient and regulated construction methods, the LVSP's petroleum use would not

[27] When considered collectively over the 30-year construction period, petroleum consumption from these activities would amount to approximately 0.33% of California's total petroleum use in 2022, the most recent year for which data is available. In that year, the state consumed approximately 26.4 billion gallons of petroleum (EIA 2024b).

be considered wasteful or inefficient. Therefore, the impact of petroleum consumption associated with construction activities under the LVSP would be **less than significant.**

Operation

Electricity

LVSP operations would require electricity for multiple purposes including, but not limited to, building heating, ventilation, and air conditioning; lighting; appliances; electronics; and off-road equipment. Additionally, the supply, conveyance, treatment, and distribution of water would indirectly result in electricity usage. The LVSP's electricity usage was based on default CalEEMod values and supplemented with project-specific data for land uses without default values available. Default electricity generation consumption in CalEEMod was based on default values for the land uses identified in CalEEMod to represent LVSP buildout. Table 4-2 shows the estimated annual operational electricity demand for each interim operational phase and buildout.

Table 4-2. Annual Operational Electricity Demand Summary

Operational Year	Electricity Demand (kilowatt-hours/year)
Phase 1 (2035)	4,627,886,007
Phase 2 (2045)	5,834,810,398
Buildout (2055)	7,701,759,506

Source: Appendix F, Energy Calculations.

As shown in Table 4-2, the LVSP is anticipated to consume approximately 4.6 billion kWh (4.6 million MWh) of electricity per year in the interim operational year of 2035, 5.8 billion kWh (5.8 million MWh) of electricity per year in the interim operational year of 2045, and 7.6 billion kWh (7.6 million MWh) of electricity per year in the buildout year of 2055.

The LVSP proposes conventional industrial uses reflecting contemporary energy-efficient/energy-conserving designs and operational programs. Future development projects part of the LVSP would not be inherently energy intensive, and the LVSP's electricity demands for each land use at buildout would be comparable to other projects of similar scale and configuration. The developments facilitated by LVSP would be required to comply with the applicable Title 24 standards, which would ensure that electricity demand would not be inefficient, wasteful, or otherwise unnecessary.

Due to the high investment costs to construct transmission lines, transmission lines owned and operated by IID are constructed to support development at the time of construction. The electrical transmission network for the Plan Area would include collector lines, or generator tie lines, which would carry electricity from generation projects (solar, geothermal, etc.) to the first and nearest substation located outside the Plan Area. Additionally, the LVSP would support the development of electrical substations and BESS projects to support the growth of energy production and energy demand in the Plan Area. Based on these considerations, electricity demand is anticipated to be accommodated within the IID load forecasting, which generally increases over time, and would not require additional capacity during peak periods. Therefore, IID has the supply and capacity to accommodate the LVSP.

Furthermore, as part of the LVSP's design process, the County considered how the LVSP could increase its reliance on renewable energy sources to meet its energy demand. The LVSP would include the development of renewable

energy sources--geothermal facilities, commercial-scale PV fields, agrivoltaics solar fields (PV systems integrated into agricultural operations), and floatovoltaic solar fields floatovoltaics (PV systems installed on bodies of water). Additionally, the LVSP would support the development of electrical substations and BESS projects to support the growth of energy production, as well as energy demand, in the Plan Area. Solar power generation would also be incorporated into the project sites through the installation of rooftop solar panels on residential and nonresidential buildings as discussed above under California Code of Regulations.

During Phases 1 and 2, approximately 1,500 acres and 1,680 acres, respectively, are anticipated to be developed for solar energy production, with an estimated annual generation of 1.9 million MWh in Phase 1 and 2.1 million MWh in Phase 2. Given the typical lifespan of solar power systems—approximately 30 years—many of these systems are expected to be decommissioned prior to full buildout of the Specific Plan area. As a result, only about 502 acres of solar power generation systems would remain operational at buildout, producing an estimated 1.89 million kWh per year.

Additionally, the LVSP would support the development of geothermal facilities, an energy source that would capitalize on the geography of the Plan Area. The LVSP would include the development of 11 geothermal facilities during Phase 1, an additional 4 facilities during Phase 2, and an additional 2 facilities during Phase 3. At buildout, a total of 17 geothermal facilities would be operational, generating approximately 22.34 million MWh of renewable energy per year. At buildout, the total renewable energy potential of the LVSP would be approximately 22.53 million MWh per year, with most of the capacity sourced from geothermal facilities.

Furthermore, the LVSP would include the development of lithium extraction and processing infrastructure and lithium battery manufacturing facilities to support the growing demand for lithium-ion batteries for use in EVs, BESS facilities, and other advanced technologies. At full buildout, approximately 4,630 acres of lithium extraction and processing infrastructure and 3,445 acres of lithium battery production facilities would be operational. Based on the County's estimates, lithium infrastructure at proposed full buildout would produce approximately 450,800 metric tons of lithium per year; for context, this amount of lithium could support the manufacture of approximately 16 million 60-kWh lithium-ion batteries.

The LVSP's integration of renewable energy technologies, in combination with BESS facilities, would help reduce regional electricity demand from carbon-intensive sources by supplying the regional grid with more renewably sourced energy, particularly during peak periods. This approach is increasingly supported by Title 24 standards, which encourage load shifting and improved energy efficiency through the use of energy storage. By storing excess renewable generation during off-peak hours and discharging it when demand is highest, BESS facilities would maximize the potential for the renewable electricity generated by the LVSP to be used to meet regional demand.

Natural Gas

Proposed development (e.g., industrial, commercial, and residential) within the Plan Area is anticipated to use natural gas for building operations. Table 4-3 shows the estimated annual operational natural gas demand for each interim operational phase and buildout.

Table 4-3. Annual Operational Natural Gas Demand Summary

Operational Year	Natural Gas Demand (kBTU/year)
Phase 1 (2035)	341,407,831

Table 4-3. Annual Operational Natural Gas Demand Summary

Operational Year	Natural Gas Demand (kBTU/year)
Phase 2 (2045)	575,567,364
Buildout (2055)	664,727,364

Source: Appendix F, Energy Calculations.
Note: kBTU = thousand British thermal units.

As shown in Table 4-3, the LVSP is anticipated to consume approximately 341,000 kBTU of natural gas per year in the interim operational year of 2035, 576,000 kBTU of natural gas per year in the interim operational year of 2045, and 665,000 kBTU of natural gas per year in the buildout operational year of 2055.

The LVSP proposes conventional industrial uses reflecting contemporary energy-efficient/energy-conserving designs and operational programs. Future development projects part of the LVSP would not be inherently energy intensive, and the LVSP's natural gas demands for each land use would be comparable to other projects of similar scale and configuration.

Natural gas infrastructure within the Plan Area would support the LVSP's natural gas demand. A north/south-trending transmission line is present east of the Plan Area, with an east/west-trending high-pressure distribution line within the Plan Area along West Hoober Road. Two other high-pressure distribution lines are located off the north–south transmission line, including one line east of Niland and another line located south of the Plan Area, from Rockwood to Westmorland. Natural gas can be reformed to produce hydrogen, which would be produced within the Plan Area. New and/or upgraded natural gas facilities would require installation of gas mains and gas laterals.

As noted above, the development facilitated by LVSP is anticipated to consume approximately 664,727,364 kBTU of natural gas per year at buildout, which would be less than the forecasted demand for the entire SoCalGas service area in 2040. The LVSP would account for approximately 0.05% of SoCalGas's total natural gas capacity in 2040. As such, because the LVSP is expected to be built out in 2055, demand is anticipated to be accommodated within the SoCalGas load forecasting, which generally increases over time, and would not require additional capacity during peak periods. Therefore, SoCalGas has the supply and capacity to accommodate the LVSP. Furthermore, the LVSP buidlout would be required to comply with the applicable Title 24 standards, which would further ensure that the LVSP's natural gas demands would not be inefficient, wasteful, or otherwise unnecessary.

Petroleum

During operations, fuel consumption resulting from the LVSP would involve the use of motor vehicles traveling to and from and within the Plan Area, stationary equipment, and line haul rail travel.

Fuel demand estimates for the LVSP at buildout are provided in Table 4-4.

Table 4-4. Annual Operational Fuel Demand Summary

Construction Phase	Vehicles (gasoline)	Vehicles (diesel)	Off-Road Equipment (diesel)	Stationary Equipment (diesel)	Rail (diesel)	Total
	Gallons					
Phase 1 (2035)	15,810,974	2,551,364	8,467,800	2,368,726	361,783	29,560,647
Phase 2 (2045)	25,183,869	5,448,043	17,607,689	2,818,336	449,283	51,507,219
Buildout (2055)	29,270,253	7,476,122	18,630,185	3,741,246	646,115	59,763,920

Source: Appendix F, Energy Calculations.

As summarized in Table 4-4, the LVSP at buildout in 2055 would result in an estimated annual fuel demand of 59,763,920 gallons of petroleum. Fuel would be provided by current and future commercial vendors.

As discussed above, automobile fuel economy is set under the Clean Air Act. California is currently litigating its ability to set ongoing fuel economy standards. However, it is legally infeasible for the County to set its own standards. 42 USC Section 7543(a) states, "No state or any political subdivision therefore shall adopt or attempt to enforce any standard relating to the control of emissions from new motor vehicles or new motor vehicle engines subject to this part." Over the lifetime of the LVSP, the fuel efficiency of the vehicles being used by the residents, visitors, and employees of the LVSP is expected to increase. Enhanced fuel economies realized pursuant to federal and state regulatory actions and related transition of vehicles to alternative energy sources (e.g., electricity, biofuels, hydrogen cells) would likely decrease future gasoline fuel demands.

As described in the LVSP, the project would implement policies that would improve transportation and circulation that would reduce fuel demand in the long term (see Section 4.3.2, Approach and Methodology). Chapter 5 of the LVSP includes circulation and transportation policies 19 through 24, which would be implemented in the LVSP to enhance transit access and connectivity of the project within the County. Specifically, these policies would allow for the development of a public transportation hub where multiple modes of transportation converge and which is designed to facilitate seamless transfers, improve accessibility, and reduce travel time for commuters. Although the County cannot mandate carpooling under state law, LVSP Policy CT-13 promotes carpooling to further reduce trips.[28] In addition, the project would implement sidewalks and trails along rivers, facilitating and encouraging pedestrian access. The project would promote the use of bicycles as an alternative means of transportation by providing short-term and/or long-term bicycle parking accommodations and by designing bike routes to connect to commercial nodes and transportation hubs in the local area.

The County would support the diversification of travel modes used in Lithium Valley to increase employee trips made by bicycle or public transit, including new mobility types like electric shuttles, electric vanpool/carpool, electric carsharing service, docked bikeshare, and e-scooter share. The County would consult with employers in or near the Plan Area to create a shuttle system connecting to and from employment centers, nearby transit hubs, and commercial destinations. Finally, the LVSP would allow for the development of EV charging stations to promote EV

[28] It is legally infeasible to mandate ridesharing (e.g. vanpool, carpool). See California Health and Safety Code Sections 40454, 40716, 40717.5, and 40717.9; and *Merced Alliance for Responsible Growth v. City of Merced* (2012 Case No. F062602) 2012 WL 5984917.

use in the area. Facilitating public transit, bicycle, shuttle, carpooling, and EV charging access for employees would reduce VMT and associated energy consumption.

The geographic context for impacts to petroleum is statewide; therefore, petroleum-based fuel usage caused by the project would not likely have a significant effect on local and regional energy supplies or require additional capacity.

Trip generation and VMT generated by the LVSP are consistent with Specific Plans of similar scale and configuration. That is, the LVSP does not propose uses or operations that would inherently result in excessive and wasteful vehicle trips and VMT or associated excess and wasteful vehicle energy consumption. As supported by the preceding discussions, project transportation energy consumption would not be considered inefficient, wasteful, or otherwise unnecessary.

Summary

As explained above, although the project would increase energy consumption during construction and operation, the project would allow for the development of renewable energy sources and would not result in wasteful, inefficient, or unnecessary consumption of energy resources, including electricity, natural gas, or petroleum, during project construction or operation. Impacts would be **less than significant**.

Level of Significance Before Mitigation

Impacts would be **less than significant**.

Mitigation Measures

No mitigation is required.

Level of Significance After Mitigation

Impacts would be **less than significant** without mitigation.

3.33. Building Construction (2026) - Unmitigated

3.35. Building Construction (2027) - Unmitigated

3.37. Building Construction (2028) - Unmitigated

3.39. Building Construction (2029) - Unmitigated

3.41. Paving (2025) - Unmitigated

3.43. Paving (2026) - Unmitigated

3.45. Paving (2027) - Unmitigated

3.47. Paving (2028) - Unmitigated

3.49. Paving (2029) - Unmitigated

3.51. Architectural Coating (2025) - Unmitigated

3.53. Architectural Coating (2026) - Unmitigated

3.55. Architectural Coating (2027) - Unmitigated

3.57. Architectural Coating (2028) - Unmitigated

3.59. Architectural Coating (2029) - Unmitigated

4. Operations Emissions Details

4.10. Soil Carbon Accumulation By Vegetation Type

4.10.1. Soil Carbon Accumulation By Vegetation Type - Unmitigated

4.10.2. Above and Belowground Carbon Accumulation by Land Use Type - Unmitigated

4.10.3. Avoided and Sequestered Emissions by Species - Unmitigated

5. Activity Data

5.1. Construction Schedule

5.2. Off-Road Equipment

5.2.1. Unmitigated

5.3. Construction Vehicles

5.3.1. Unmitigated

5.4. Vehicles

5.4.1. Construction Vehicle Control Strategies

5.5. Architectural Coatings

5.6. Dust Mitigation

5.6.1. Construction Earthmoving Activities

5.6.2. Construction Earthmoving Control Strategies

5.7. Construction Paving

5.8. Construction Electricity Consumption and Emissions Factors

5.18. Vegetation

5.18.1. Land Use Change

5.18.1.1. Unmitigated

5.18.1. Biomass Cover Type

5.18.1.1. Unmitigated

5.18.2. Sequestration

5.18.2.1. Unmitigated

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

6.2. Initial Climate Risk Scores

6.3. Adjusted Climate Risk Scores

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

7.2. Healthy Places Index Scores

7.3. Overall Health & Equity Scores

7.4. Health & Equity Measures

7.5. Evaluation Scorecard

7.6. Health & Equity Custom Measures

8. User Changes to Default Data

1. Basic Project Information

1.1. Basic Project Information

Data Field	Value
Project Name	Lithium Valley SP Construction - Phase 1 (2025-2029)
Construction Start Date	1/1/2025
Lead Agency	—
Land Use Scale	Project/site
Analysis Level for Defaults	County
Windspeed (m/s)	3.40
Precipitation (days)	4.80
Location	33.18829759139308, -115.6026869228474
County	Imperial
City	Unincorporated
Air District	Imperial County APCD
Air Basin	Salton Sea
TAZ	5600
EDFZ	19
Electric Utility	Imperial Irrigation District
Gas Utility	Southern California Gas
App Version	2022.1.1.29

1.2. Land Use Types

Land Use Subtype	Size	Unit	Lot Acreage	Building Area (sq ft)	Landscape Area (sq ft)	Special Landscape Area (sq ft)	Population	Description
General Heavy Industry	25.0	1000sqft	0.57	25,000	2,500	—	—	—

General Office Building	266	1000sqft	6.12	266,397	26,659	—	—	—
General Heavy Industry	756	1000sqft	17.3	755,681	75,568	—	—	—
General Heavy Industry	9,923	1000sqft	228	7,541,382	754,154	—	—	—
Manufacturing	1,498	1000sqft	34.4	1,498,069	149,803	—	—	—
Manufacturing	2,273	1000sqft	52.2	2,272,527	227,253	—	—	—

1.3. User-Selected Emission Reduction Measures by Emissions Sector

No measures selected

2. Emissions Summary

2.1. Construction Emissions Compared Against Thresholds

Criteria Pollutants (lb/day for daily, ton/yr for annual) and GHGs (lb/day for daily, MT/yr for annual)

Un/Mit.	TOG	ROG	NOx	CO	SO2	PM10E	PM10D	PM10T	PM2.5E	PM2.5D	PM2.5T	BCO2	NBCO2	CO2T	CH4	N2O	R	CO2e
Daily, Summer (Max)	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Unmit.	221	212	243	1,613	1.74	3.39	126,251	126,254	3.39	12,624	12,628	—	320,287	320,287	10.5	16.2	652	326,028
Daily, Winter (Max)	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Unmit.	206	201	262	1,215	1.74	3.39	126,251	126,254	3.39	12,624	12,628	—	301,664	301,664	10.8	16.2	16.9	306,779
Average Daily (Max)	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Unmit.	152	146	184	964	1.25	2.43	89,238	89,241	2.43	8,924	8,926	—	220,913	220,913	7.47	11.6	201	224,749
Annual (Max)	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Unmit.	27.7	26.6	33.5	176	0.23	0.44	16,286	16,286	0.44	1,629	1,629	—	36,575	36,575	1.24	1.92	33.3	37,210

2.2. Construction Emissions by Year, Unmitigated

Criteria Pollutants (lb/day for daily, ton/yr for annual) and GHGs (lb/day for daily, MT/yr for annual)

Year	TOG	ROG	NOx	CO	SO2	PM10E	PM10D	PM10T	PM2.5E	PM2.5D	PM2.5T	BCO2	NBCO2	CO2T	CH4	N2O	R	CO2e
Daily - Summer (Max)	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
2025	221	212	243	1,613	1.74	3.39	126,251	126,254	3.39	12,624	12,628	—	320,287	320,287	10.5	16.2	652	326,028

5.18.1.1. Unmitigated

Vegetation Land Use Type	Vegetation Soil Type	Initial Acres	Final Acres

5.18.1. Biomass Cover Type

5.18.1.1. Unmitigated

Biomass Cover Type	Initial Acres	Final Acres

5.18.2. Sequestration

5.18.2.1. Unmitigated

Tree Type	Number	Electricity Saved (kWh/year)	Natural Gas Saved (btu/year)

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	32.8	annual days of extreme heat
Extreme Precipitation	0.00	annual days with precipitation above 20 mm
Sea Level Rise	—	meters of inundation depth
Wildfire	0.19	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters
Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	N/A	N/A	N/A	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	N/A	N/A	N/A	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.

The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—
AQ-Ozone	11.6
AQ-PM	19.1
AQ-DPM	9.09
Drinking Water	30.6
Lead Risk Housing	50.8
Pesticides	90.5
Toxic Releases	7.58
Traffic	3.06
Effect Indicators	—
CleanUp Sites	74.2
Groundwater	77.9
Haz Waste Facilities/Generators	93.2
Impaired Water Bodies	100.0
Solid Waste	86.5
Sensitive Population	—
Asthma	87.6
Cardio-vascular	83.2
Low Birth Weights	26.9
Socioeconomic Factor Indicators	—

Education	82.7
Housing	51.4
Linguistic	88.8
Poverty	94.9
Unemployment	99.3

7.2. Healthy Places Index Scores

The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Economic	—
Above Poverty	16.66880534
Employed	7.173104068
Median HI	5.299627871
Education	—

7.3. Overall Health & Equity Scores

Metric	Result for Project Census Tract
CalEnviroScreen 4.0 Score for Project Location (a)	82.0
Healthy Places Index Score for Project Location (b)	11.0
Project Located in a Designated Disadvantaged Community (Senate Bill 535)	Yes
Project Located in a Low-Income Community (Assembly Bill 1550)	Yes
Project Located in a Community Air Protection Program Community (Assembly Bill 617)	No

a: The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.
b: The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

7.4. Health & Equity Measures

No Health & Equity Measures selected.

7.5. Evaluation Scorecard

Health & Equity Evaluation Scorecard not completed.

7.6. Health & Equity Custom Measures

No Health & Equity Custom Measures created.

8. User Changes to Default Data

Screen	Justification
Construction: Construction Phases	Land use data are based applicant-provided buildout assumptions. Phase 1 (2025-2029) represents 50% of 10-year buildout.
Construction: Off-Road Equipment	Equipment increased based on scaler per buildout methodology.
Construction: Trips and VMT	Trips increased based on scaler per buildout methodology.
Construction: On-Road Fugitive Dust	85% paved roads assumed, according to ICAPCD guidance. PM reductions altered based on dust control plan implementation strategies (watering unpaved roads three times per day).
Construction: Paving	Paved area acreages calculated based on buildout estimates. Conservatively assumed 100% asphalt.
Land Use	Land use info based on applicant-provided buildout.

Biomass Cover Type	Initial Acres	Final Acres

5.18.2. Sequestration

5.18.2.1. Unmitigated

Tree Type	Number	Electricity Saved (kWh/year)	Natural Gas Saved (btu/year)

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	32.8	annual days of extreme heat
Extreme Precipitation	0.00	annual days with precipitation above 20 mm
Sea Level Rise	—	meters of inundation depth
Wildfire	0.19	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters
Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	N/A	N/A	N/A	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	N/A	N/A	N/A	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.

The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—
AQ-Ozone	11.6
AQ-PM	19.1
AQ-DPM	9.09
Drinking Water	30.6
Lead Risk Housing	50.8
Pesticides	90.5
Toxic Releases	7.58
Traffic	3.06
Effect Indicators	—
CleanUp Sites	74.2
Groundwater	77.9
Haz Waste Facilities/Generators	93.2
Impaired Water Bodies	100.0
Solid Waste	86.5
Sensitive Population	—
Asthma	87.6
Cardio-vascular	83.2
Low Birth Weights	26.9
Socioeconomic Factor Indicators	—

Education	82.7
Housing	51.4
Linguistic	88.8
Poverty	94.9
Unemployment	99.3

7.2. Healthy Places Index Scores

The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Economic	—
Above Poverty	16.66880534
Employed	7.173104068
Median HI	5.299627871
Education	—

7.3. Overall Health & Equity Scores

Metric	Result for Project Census Tract
CalEnviroScreen 4.0 Score for Project Location (a)	82.0
Healthy Places Index Score for Project Location (b)	11.0
Project Located in a Designated Disadvantaged Community (Senate Bill 535)	Yes
Project Located in a Low-Income Community (Assembly Bill 1550)	Yes
Project Located in a Community Air Protection Program Community (Assembly Bill 617)	No

a: The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.
b: The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

7.4. Health & Equity Measures

No Health & Equity Measures selected.

7.5. Evaluation Scorecard

Health & Equity Evaluation Scorecard not completed.

7.6. Health & Equity Custom Measures

No Health & Equity Custom Measures created.

8. User Changes to Default Data

Screen	Justification
Construction: Construction Phases	Land use data are based applicant-provided buildout assumptions. Phase 1 (2030-2034) represents 50% of 10-year buildout.
Construction: Off-Road Equipment	Equipment increased based on scaler per buildout methodology.
Construction: Trips and VMT	Trips increased based on scaler per buildout methodology.
Construction: On-Road Fugitive Dust	85% paved roads assumed, according to ICAPCD guidance. PM reductions altered based on dust control plan implementation strategies (watering unpaved roads three times per day).
Construction: Paving	Paved area acreages calculated based on buildout estimates. Conservatively assumed 100% asphalt.
Land Use	Land use info based on applicant-provided buildout.

Grading	Worker	160	18.5	LDA,LDT1,LDT2
Grading	Vendor	32.0	10.2	HHDT,MHDT
Grading	Hauling	0.00	20.0	HHDT
Grading	Onsite truck	—	—	HHDT

5.4. Vehicles

5.4.1. Construction Vehicle Control Strategies

Control Strategies Applied	PM10 Reduction	PM2.5 Reduction
Water unpaved roads twice daily	55%	55%
Limit vehicle speeds on unpaved roads to 25 mph	44%	44%
Sweep paved roads once per month	9%	9%

5.5. Architectural Coatings

Phase Name	Residential Interior Area Coated (sq ft)	Residential Exterior Area Coated (sq ft)	Non-Residential Interior Area Coated (sq ft)	Non-Residential Exterior Area Coated (sq ft)	Parking Area Coated (sq ft)

5.6. Dust Mitigation

5.6.1. Construction Earthmoving Activities

Phase Name	Material Imported (cy)	Material Exported (cy)	Acres Graded (acres)	Material Demolished (sq. ft.)	Acres Paved (acres)
Site Preparation	—	—	31,296	0.00	—
Grading	—	—	62,592	0.00	—

5.6.2. Construction Earthmoving Control Strategies

Control Strategies Applied	Frequency (per day)	PM10 Reduction	PM2.5 Reduction
Water Exposed Area	3	74%	74%

5.7. Construction Paving

Land Use	Area Paved (acres)	% Asphalt
City Park	0.00	0%

5.8. Construction Electricity Consumption and Emissions Factors

kWh per Year and Emission Factor (lb/MWh)

Year	kWh per Year	CO2	CH4	N2O
2025	0.00	457	0.03	< 0.005
2026	0.00	457	0.03	< 0.005
2027	0.00	457	0.03	< 0.005
2028	0.00	457	0.03	< 0.005
2029	0.00	457	0.03	< 0.005
2030	0.00	457	0.03	< 0.005
2031	0.00	457	0.03	< 0.005
2032	0.00	457	0.03	< 0.005
2033	0.00	457	0.03	< 0.005
2034	0.00	457	0.03	< 0.005

5.18. Vegetation

5.18.1. Land Use Change

5.18.1.1. Unmitigated

Vegetation Land Use Type	Vegetation Soil Type	Initial Acres	Final Acres

5.18.1. Biomass Cover Type

5.18.1.1. Unmitigated

Biomass Cover Type	Initial Acres	Final Acres

5.18.2. Sequestration

5.18.2.1. Unmitigated

Tree Type	Number	Electricity Saved (kWh/year)	Natural Gas Saved (btu/year)

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	32.8	annual days of extreme heat
Extreme Precipitation	0.00	annual days with precipitation above 20 mm
Sea Level Rise	—	meters of inundation depth
Wildfire	0.19	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters
Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	N/A	N/A	N/A	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	N/A	N/A	N/A	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.

The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—
AQ-Ozone	11.6
AQ-PM	19.1
AQ-DPM	9.09
Drinking Water	30.6
Lead Risk Housing	50.8
Pesticides	90.5
Toxic Releases	7.58
Traffic	3.06
Effect Indicators	—
CleanUp Sites	74.2
Groundwater	77.9
Haz Waste Facilities/Generators	93.2
Impaired Water Bodies	100.0
Solid Waste	86.5
Sensitive Population	—
Asthma	87.6
Cardio-vascular	83.2
Low Birth Weights	26.9

Socioeconomic Factor Indicators	—
Education	82.7
Housing	51.4
Linguistic	88.8
Poverty	94.9
Unemployment	99.3

7.2. Healthy Places Index Scores

The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Economic	—
Above Poverty	16.66880534
Employed	7.173104068
Median HI	5.299627871
Education	—
Bachelor's or higher	5.017323239

7.3. Overall Health & Equity Scores

Metric	Result for Project Census Tract
CalEnviroScreen 4.0 Score for Project Location (a)	82.0
Healthy Places Index Score for Project Location (b)	11.0
Project Located in a Designated Disadvantaged Community (Senate Bill 535)	Yes
Project Located in a Low-Income Community (Assembly Bill 1550)	Yes
Project Located in a Community Air Protection Program Community (Assembly Bill 617)	No

a: The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.
b: The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

7.4. Health & Equity Measures

No Health & Equity Measures selected.

7.5. Evaluation Scorecard

Health & Equity Evaluation Scorecard not completed.

7.6. Health & Equity Custom Measures

No Health & Equity Custom Measures created.

8. User Changes to Default Data

Screen	Justification
Construction: Construction Phases	Land use data are based applicant-provided buildout assumptions. Phase 1 - Floodway represents the buildout for construction of floodway and conservation land use designations.
Construction: Off-Road Equipment	Equipment increased based on scaler per buildout methodology.
Construction: Trips and VMT	Trips increased based on scaler per buildout methodology.
Construction: On-Road Fugitive Dust	85% paved roads assumed, according to ICAPCD guidance. PM reductions altered based on dust control plan implementation strategies (watering unpaved roads three times per day).

5.4. Vehicles

5.4.1. Construction Vehicle Control Strategies

Control Strategies Applied	PM10 Reduction	PM2.5 Reduction
Water unpaved roads twice daily	74%	74%
Limit vehicle speeds on unpaved roads to 25 mph	44%	44%
Sweep paved roads once per month	9%	9%

5.5. Architectural Coatings

Phase Name	Residential Interior Area Coated (sq ft)	Residential Exterior Area Coated (sq ft)	Non-Residential Interior Area Coated (sq ft)	Non-Residential Exterior Area Coated (sq ft)	Parking Area Coated (sq ft)
Architectural Coating	0.00	0.00	10,150,824	3,383,608	—

5.6. Dust Mitigation

5.6.1. Construction Earthmoving Activities

Phase Name	Material Imported (cy)	Material Exported (cy)	Acres Graded (acres)	Material Demolished (Building Square Footage)	Acres Paved (acres)
Demolition	0.00	0.00	0.00	50,000	—
Site Preparation	—	—	5,873	0.00	—
Grading	125,000	125,000	11,745	0.00	—
Paving	0.00	0.00	0.00	0.00	6,009

5.6.2. Construction Earthmoving Control Strategies

Control Strategies Applied	Frequency (per day)	PM10 Reduction	PM2.5 Reduction
Water Exposed Area	3	74%	74%
Water Demolished Area	2	36%	36%

5.7. Construction Paving

Land Use	Area Paved (acres)	% Asphalt
General Office Building	361	100%
General Heavy Industry	1,925	100%
General Heavy Industry	1,196	100%
Manufacturing	603	100%
Manufacturing	1,922	100%

5.8. Construction Electricity Consumption and Emissions Factors

kWh per Year and Emission Factor (lb/MWh)

Year	kWh per Year	CO2	CH4	N2O
2035	0.00	457	0.03	< 0.005
2036	0.00	457	0.03	< 0.005
2037	0.00	457	0.03	< 0.005
2038	0.00	457	0.03	< 0.005
2039	0.00	457	0.03	< 0.005

5.18. Vegetation

5.18.1. Land Use Change

5.18.1.1. Unmitigated

Vegetation Land Use Type	Vegetation Soil Type	Initial Acres	Final Acres

5.18.1. Biomass Cover Type

5.18.1.1. Unmitigated

Biomass Cover Type	Initial Acres	Final Acres

5.18.2. Sequestration

5.18.2.1. Unmitigated

Tree Type	Number	Electricity Saved (kWh/year)	Natural Gas Saved (btu/year)

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	32.8	annual days of extreme heat
Extreme Precipitation	0.00	annual days with precipitation above 20 mm
Sea Level Rise	—	meters of inundation depth
Wildfire	0.19	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters
Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A

Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	N/A	N/A	N/A	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	N/A	N/A	N/A	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—
AQ-Ozone	11.6
AQ-PM	19.1
AQ-DPM	9.09
Drinking Water	30.6
Lead Risk Housing	50.8
Pesticides	90.5
Toxic Releases	7.58
Traffic	3.06
Effect Indicators	—
CleanUp Sites	74.2
Groundwater	77.9
Haz Waste Facilities/Generators	93.2
Impaired Water Bodies	100.0
Solid Waste	86.5
Sensitive Population	—
Asthma	87.6
Cardio-vascular	83.2
Low Birth Weights	26.9
Socioeconomic Factor Indicators	—
Education	82.7
Housing	51.4
Linguistic	88.8

Poverty	94.9
Unemployment	99.3

7.2. Healthy Places Index Scores

The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Economic	—
Above Poverty	16.66880534
Employed	7.173104068
Median HI	5.299627871
Education	—

7.3. Overall Health & Equity Scores

Metric	Result for Project Census Tract
CalEnviroScreen 4.0 Score for Project Location (a)	82.0
Healthy Places Index Score for Project Location (b)	11.0
Project Located in a Designated Disadvantaged Community (Senate Bill 535)	Yes
Project Located in a Low-Income Community (Assembly Bill 1550)	Yes
Project Located in a Community Air Protection Program Community (Assembly Bill 617)	No

a: The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.
b: The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

7.4. Health & Equity Measures

No Health & Equity Measures selected.

7.5. Evaluation Scorecard

Health & Equity Evaluation Scorecard not completed.

7.6. Health & Equity Custom Measures

No Health & Equity Custom Measures created.

8. User Changes to Default Data

Screen	Justification
Construction: Construction Phases	Land use data are based applicant-provided buildout assumptions. Phase 2 (2035-2039) represents 50% of 10-year buildout.
Construction: Off-Road Equipment	Equipment increased based on scaler per buildout methodology.
Construction: Trips and VMT	Trips increased based on scaler per buildout methodology.
Construction: On-Road Fugitive Dust	All roads used by future developments projects within the Specific Plan Area would be required to be paved. Per ICAPCD guidance a value of 85% paved is assumed in the modeling to account for the high levels of entrained dust generated from vehicle travel on paved roadways in the region. PM reductions altered based on dust control plan implementation strategies (watering unpaved roads three times per day).
Construction: Paving	Paved area acreages calculated based on buildout estimates. Conservatively assumed 100% asphalt.

5.4. Vehicles

5.4.1. Construction Vehicle Control Strategies

Control Strategies Applied	PM10 Reduction	PM2.5 Reduction
Water unpaved roads twice daily	74%	74%
Limit vehicle speeds on unpaved roads to 25 mph	44%	44%
Sweep paved roads once per month	9%	9%

5.5. Architectural Coatings

Phase Name	Residential Interior Area Coated (sq ft)	Residential Exterior Area Coated (sq ft)	Non-Residential Interior Area Coated (sq ft)	Non-Residential Exterior Area Coated (sq ft)	Parking Area Coated (sq ft)
Architectural Coating	0.00	0.00	10,150,824	3,383,608	—

5.6. Dust Mitigation

5.6.1. Construction Earthmoving Activities

Phase Name	Material Imported (cy)	Material Exported (cy)	Acres Graded (acres)	Material Demolished (Building Square Footage)	Acres Paved (acres)
Demolition	0.00	0.00	0.00	50,000	—
Site Preparation	—	—	5,873	0.00	—
Grading	125,000	125,000	11,745	0.00	—
Paving	0.00	0.00	0.00	0.00	6,009

5.6.2. Construction Earthmoving Control Strategies

Control Strategies Applied	Frequency (per day)	PM10 Reduction	PM2.5 Reduction
Water Exposed Area	3	74%	74%
Water Demolished Area	2	36%	36%

5.7. Construction Paving

Land Use	Area Paved (acres)	% Asphalt
General Office Building	361	100%
General Heavy Industry	1,925	100%
General Heavy Industry	1,196	100%
Manufacturing	603	100%
Manufacturing	1,922	100%

5.8. Construction Electricity Consumption and Emissions Factors

kWh per Year and Emission Factor (lb/MWh)

Year	kWh per Year	CO2	CH4	N2O
2040	0.00	457	0.03	< 0.005
2041	0.00	457	0.03	< 0.005
2042	0.00	457	0.03	< 0.005
2043	0.00	457	0.03	< 0.005
2044	0.00	457	0.03	< 0.005

5.18. Vegetation

5.18.1. Land Use Change

5.18.1.1. Unmitigated

Vegetation Land Use Type	Vegetation Soil Type	Initial Acres	Final Acres

5.18.1. Biomass Cover Type

5.18.1.1. Unmitigated

Biomass Cover Type	Initial Acres	Final Acres

5.18.2. Sequestration

5.18.2.1. Unmitigated

Tree Type	Number	Electricity Saved (kWh/year)	Natural Gas Saved (btu/year)

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	32.8	annual days of extreme heat
Extreme Precipitation	0.00	annual days with precipitation above 20 mm
Sea Level Rise	—	meters of inundation depth
Wildfire	0.19	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters
Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A

Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	N/A	N/A	N/A	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	N/A	N/A	N/A	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—
AQ-Ozone	11.6
AQ-PM	19.1
AQ-DPM	9.09
Drinking Water	30.6
Lead Risk Housing	50.8
Pesticides	90.5
Toxic Releases	7.58
Traffic	3.06
Effect Indicators	—
CleanUp Sites	74.2
Groundwater	77.9
Haz Waste Facilities/Generators	93.2
Impaired Water Bodies	100.0
Solid Waste	86.5
Sensitive Population	—

7.3. Overall Health & Equity Scores

Metric	Result for Project Census Tract
CalEnviroScreen 4.0 Score for Project Location (a)	82.0
Healthy Places Index Score for Project Location (b)	11.0
Project Located in a Designated Disadvantaged Community (Senate Bill 535)	Yes
Project Located in a Low-Income Community (Assembly Bill 1550)	Yes
Project Located in a Community Air Protection Program Community (Assembly Bill 617)	No

a: The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.
b: The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

7.4. Health & Equity Measures

No Health & Equity Measures selected.

7.5. Evaluation Scorecard

Health & Equity Evaluation Scorecard not completed.

7.6. Health & Equity Custom Measures

No Health & Equity Custom Measures created.

8. User Changes to Default Data

Screen	Justification
Construction: Construction Phases	Land use data are based applicant-provided buildout assumptions. Phase 2 (2040-2044) represents 50% of 10-year buildout.
Construction: Off-Road Equipment	Equipment increased based on scaler per buildout methodology.
Construction: Trips and VMT	Trips increased based on scaler per buildout methodology.
Construction: On-Road Fugitive Dust	All roads used by future developments projects within the Specific Plan Area would be required to be paved. Per ICAPCD guidance a value of 85% paved is assumed in the modeling to account for the high levels of entrained dust generated from vehicle travel on paved roadways in the region. PM reductions altered based on dust control plan implementation strategies (watering unpaved roads three times per day).
Construction: Paving	Paved area acreages calculated based on buildout estimates. Conservatively assumed 100% asphalt.

Lithium Valley SP Construction - Phase 3 (2045-2049) Detailed Report

5.18.1. Land Use Change

5.18.1.1. Unmitigated

Vegetation Land Use Type	Vegetation Soil Type	Initial Acres	Final Acres

5.18.1. Biomass Cover Type

5.18.1.1. Unmitigated

Biomass Cover Type	Initial Acres	Final Acres

5.18.2. Sequestration

5.18.2.1. Unmitigated

Tree Type	Number	Electricity Saved (kWh/year)	Natural Gas Saved (btu/year)

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	—	annual days of extreme heat
Extreme Precipitation	—	annual days with precipitation above 20 mm
Sea Level Rise	—	meters of inundation depth
Wildfire	—	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters
Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	N/A	N/A	N/A	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.

The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	N/A	N/A	N/A	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—
AQ-Ozone	11.6
AQ-PM	19.1

AQ-DPM	9.09
Drinking Water	30.6
Lead Risk Housing	50.8
Pesticides	90.5
Toxic Releases	7.58
Traffic	3.06
Effect Indicators	—
CleanUp Sites	74.2
Groundwater	77.9
Haz Waste Facilities/Generators	93.2
Impaired Water Bodies	100.0
Solid Waste	86.5
Sensitive Population	—
Asthma	87.6
Cardio-vascular	83.2
Low Birth Weights	26.9
Socioeconomic Factor Indicators	—
Education	82.7
Housing	51.4
Linguistic	88.8
Poverty	94.9
Unemployment	99.3

7.2. Healthy Places Index Scores

The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Economic	—
Above Poverty	16.66880534

Employed	7.173104068
Median HI	5.299627871
Education	—
Bachelor's or higher	5.017323239
High school enrollment	16.8741178
Preschool enrollment	68.89516233
Transportation	—
Auto Access	18.40112922
Active commuting	51.10997049
Social	—
2-parent households	13.28114975
Voting	16.79712563

7.3. Overall Health & Equity Scores

Metric	Result for Project Census Tract
CalEnviroScreen 4.0 Score for Project Location (a)	82.0
Healthy Places Index Score for Project Location (b)	11.0
Project Located in a Designated Disadvantaged Community (Senate Bill 535)	Yes
Project Located in a Low-Income Community (Assembly Bill 1550)	Yes
Project Located in a Community Air Protection Program Community (Assembly Bill 617)	No

a: The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.
b: The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

7.4. Health & Equity Measures

No Health & Equity Measures selected.

7.5. Evaluation Scorecard

Health & Equity Evaluation Scorecard not completed.

7.6. Health & Equity Custom Measures

No Health & Equity Custom Measures created.

8. User Changes to Default Data

Screen	Justification

Construction: Construction Phases	Land use data are based applicant-provided buildout assumptions. Phase 3 (2045-2049) represents 50% of 10-year buildout.
Construction: Off-Road Equipment	Equipment increased based on scaler per buildout methodology.
Construction: Trips and VMT	Trips increased based on scaler per buildout methodology.
Construction: On-Road Fugitive Dust	All roads used by future developments projects within the Specific Plan Area would be required to be paved. Per ICAPCD guidance a value of 85% paved is assumed in the modeling to account for the high levels of entrained dust generated from vehicle travel on paved roadways in the region. PM reductions altered based on dust control plan implementation strategies (watering unpaved roads three times per day).
Construction: Paving	Paved area acreages calculated based on buildout estimates. Conservatively assumed 100% asphalt.

5.4. Vehicles

5.4.1. Construction Vehicle Control Strategies

Control Strategies Applied	PM10 Reduction	PM2.5 Reduction
Water unpaved roads twice daily	74%	74%
Limit vehicle speeds on unpaved roads to 25 mph	44%	44%
Sweep paved roads once per month	9%	9%

5.5. Architectural Coatings

Phase Name	Residential Interior Area Coated (sq ft)	Residential Exterior Area Coated (sq ft)	Non-Residential Interior Area Coated (sq ft)	Non-Residential Exterior Area Coated (sq ft)	Parking Area Coated (sq ft)
Architectural Coating	0.00	0.00	6,569,501	2,189,834	—

5.6. Dust Mitigation

5.6.1. Construction Earthmoving Activities

Phase Name	Material Imported (cy)	Material Exported (cy)	Acres Graded (acres)	Material Demolished (Building Square Footage)	Acres Paved (acres)
Demolition	0.00	0.00	0.00	50,000	—
Site Preparation	—	—	5,873	0.00	—
Grading	125,000	125,000	11,745	0.00	—
Paving	0.00	0.00	0.00	0.00	6,303

5.6.2. Construction Earthmoving Control Strategies

Control Strategies Applied	Frequency (per day)	PM10 Reduction	PM2.5 Reduction
Water Exposed Area	3	74%	74%
Water Demolished Area	2	36%	36%

5.7. Construction Paving

Land Use	Area Paved (acres)	% Asphalt
General Heavy Industry	3,977	100%
Manufacturing	1,144	100%
Manufacturing	276	100%
General Heavy Industry	905	100%

5.8. Construction Electricity Consumption and Emissions Factors

kWh per Year and Emission Factor (lb/MWh)

Year	kWh per Year	CO2	CH4	N2O
2045	0.00	457	0.03	< 0.005
2046	0.00	457	0.03	< 0.005
2047	0.00	457	0.03	< 0.005
2048	0.00	457	0.03	< 0.005
2049	0.00	457	0.03	< 0.005

5.18. Vegetation

5.18.1. Land Use Change

5.18.1.1. Unmitigated

Vegetation Land Use Type	Vegetation Soil Type	Initial Acres	Final Acres

5.18.1. Biomass Cover Type

5.18.1.1. Unmitigated

Biomass Cover Type	Initial Acres	Final Acres

5.18.2. Sequestration

5.18.2.1. Unmitigated

Tree Type	Number	Electricity Saved (kWh/year)	Natural Gas Saved (btu/year)

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	—	annual days of extreme heat
Extreme Precipitation	—	annual days with precipitation above 20 mm
Sea Level Rise	—	meters of inundation depth
Wildfire	—	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters
Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	N/A	N/A	N/A	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.

The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	N/A	N/A	N/A	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—
AQ-Ozone	11.6
AQ-PM	19.1

AQ-DPM	9.09
Drinking Water	30.6
Lead Risk Housing	50.8
Pesticides	90.5
Toxic Releases	7.58
Traffic	3.06
Effect Indicators	—
CleanUp Sites	74.2
Groundwater	77.9
Haz Waste Facilities/Generators	93.2
Impaired Water Bodies	100.0
Solid Waste	86.5
Sensitive Population	—
Asthma	87.6
Cardio-vascular	83.2
Low Birth Weights	26.9
Socioeconomic Factor Indicators	—
Education	82.7
Housing	51.4
Linguistic	88.8
Poverty	94.9
Unemployment	99.3

7.2. Healthy Places Index Scores

The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Economic	—
Above Poverty	16.66880534

Employed	7.173104068
Median HI	5.299627871
Education	—

7.3. Overall Health & Equity Scores

Metric	Result for Project Census Tract
CalEnviroScreen 4.0 Score for Project Location (a)	82.0
Healthy Places Index Score for Project Location (b)	11.0
Project Located in a Designated Disadvantaged Community (Senate Bill 535)	Yes
Project Located in a Low-Income Community (Assembly Bill 1550)	Yes
Project Located in a Community Air Protection Program Community (Assembly Bill 617)	No

a: The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.
b: The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

7.4. Health & Equity Measures

No Health & Equity Measures selected.

7.5. Evaluation Scorecard

Health & Equity Evaluation Scorecard not completed.

7.6. Health & Equity Custom Measures

No Health & Equity Custom Measures created.

8. User Changes to Default Data

Screen	Justification

Construction: Construction Phases	Land use data are based applicant-provided buildout assumptions. Phase 3 (2050-2054) represents 50% of 10-year buildout. CalEEMod limits dates to those before 1/1/2050; therefore, the actual construction dates for Phase 3B are not modeled.
Construction: Off-Road Equipment	Equipment increased based on scaler per buildout methodology.
Construction: Trips and VMT	Trips increased based on scaler per buildout methodology.
Construction: On-Road Fugitive Dust	All roads used by future developments projects within the Specific Plan Area would be required to be paved. Per ICAPCD guidance a value of 85% paved is assumed in the modeling to account for the high levels of entrained dust generated from vehicle travel on paved roadways in the region. PM reductions altered based on dust control plan implementation strategies (watering unpaved roads three times per day).
Construction: Paving	Paved area acreages calculated based on buildout estimates. Conservatively assumed 100% asphalt.

Biomass Cover Type	Initial Acres	Final Acres

5.18.2. Sequestration

5.18.2.1. Unmitigated

Tree Type	Number	Electricity Saved (kWh/year)	Natural Gas Saved (btu/year)

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	32.8	annual days of extreme heat
Extreme Precipitation	0.00	annual days with precipitation above 20 mm
Sea Level Rise	—	meters of inundation depth
Wildfire	0.19	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters
Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	N/A	N/A	N/A	N/A

Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	N/A	N/A	N/A	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—
AQ-Ozone	11.6
AQ-PM	19.1
AQ-DPM	9.09
Drinking Water	30.6
Lead Risk Housing	50.8
Pesticides	90.5
Toxic Releases	7.58
Traffic	3.06
Effect Indicators	—
CleanUp Sites	74.2
Groundwater	77.9
Haz Waste Facilities/Generators	93.2
Impaired Water Bodies	100.0
Solid Waste	86.5
Sensitive Population	—
Asthma	87.6
Cardio-vascular	83.2
Low Birth Weights	26.9
Socioeconomic Factor Indicators	—
Education	82.7
Housing	51.4
Linguistic	88.8
Poverty	94.9
Unemployment	99.3

7.2. Healthy Places Index Scores

The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Economic	—
Above Poverty	16.66880534
Employed	7.173104068
Median HI	5.299627871
Education	—

7.3. Overall Health & Equity Scores

Metric	Result for Project Census Tract
CalEnviroScreen 4.0 Score for Project Location (a)	82.0
Healthy Places Index Score for Project Location (b)	11.0
Project Located in a Designated Disadvantaged Community (Senate Bill 535)	Yes
Project Located in a Low-Income Community (Assembly Bill 1550)	Yes
Project Located in a Community Air Protection Program Community (Assembly Bill 617)	No

a: The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.
b: The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

7.4. Health & Equity Measures

No Health & Equity Measures selected.

7.5. Evaluation Scorecard

Health & Equity Evaluation Scorecard not completed.

7.6. Health & Equity Custom Measures

No Health & Equity Custom Measures created.

8. User Changes to Default Data

Screen	Justification
Construction: Construction Phases	Drilling phase represents the sum of drilling for 11 geothermal facilities, each requiring a 19-month drilling phase. Overlap would occur.
Construction: Off-Road Equipment	Equipment mix is based on example project for geothermal well drilling. Drilling operations would be conducted 24 hours/day. The Specific Plan has committed to Tier 4 Final engines for construction equipment.
Construction: Trips and VMT	Vendor trucks added based on geothermal project example.
Land Use	Building square footage is based on the expected number of geothermal facilities, based on applicant-provided information. Landscape area is included in other construction runs.

5.3. Construction Vehicles

5.3.1. Unmitigated

Phase Name	Trip Type	One-Way Trips per Day	Miles per Trip	Vehicle Mix
Drilling- All Facilities	—	—	—	—
Drilling- All Facilities	Worker	34.0	18.5	LDA,LDT1,LDT2
Drilling- All Facilities	Vendor	10.0	10.2	HHDT,MHDT
Drilling- All Facilities	Hauling	44.2	20.0	HHDT
Drilling- All Facilities	Onsite truck	—	—	HHDT

5.4. Vehicles

5.4.1. Construction Vehicle Control Strategies

Control Strategies Applied	PM10 Reduction	PM2.5 Reduction
Water unpaved roads twice daily	55%	55%
Limit vehicle speeds on unpaved roads to 25 mph	44%	44%
Sweep paved roads once per month	9%	9%

5.5. Architectural Coatings

Phase Name	Residential Interior Area Coated (sq ft)	Residential Exterior Area Coated (sq ft)	Non-Residential Interior Area Coated (sq ft)	Non-Residential Exterior Area Coated (sq ft)	Parking Area Coated (sq ft)

5.6. Dust Mitigation

5.6.1. Construction Earthmoving Activities

Phase Name	Material Imported (Cubic Yards)	Material Exported (Cubic Yards)	Acres Graded (acres)	Material Demolished (sq. ft.)	Acres Paved (acres)
Drilling- All Facilities	55,808	497,808	0.00	0.00	—

5.6.2. Construction Earthmoving Control Strategies

Control Strategies Applied	Frequency (per day)	PM10 Reduction	PM2.5 Reduction
Water Exposed Area	3	74%	74%

5.7. Construction Paving

Land Use	Area Paved (acres)	% Asphalt
General Heavy Industry	0.00	0%

5.8. Construction Electricity Consumption and Emissions Factors

kWh per Year and Emission Factor (lb/MWh)

Year	kWh per Year	CO2	CH4	N2O
2035	0.00	457	0.03	< 0.005
2036	0.00	457	0.03	< 0.005
2037	0.00	457	0.03	< 0.005
2038	0.00	457	0.03	< 0.005
2039	0.00	457	0.03	< 0.005
2040	0.00	457	0.03	< 0.005

5.18. Vegetation

5.18.1. Land Use Change

5.18.1.1. Unmitigated

Vegetation Land Use Type	Vegetation Soil Type	Initial Acres	Final Acres

5.18.1. Biomass Cover Type

5.18.1.1. Unmitigated

Biomass Cover Type	Initial Acres	Final Acres

5.18.2. Sequestration

5.18.2.1. Unmitigated

Tree Type	Number	Electricity Saved (kWh/year)	Natural Gas Saved (btu/year)

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	32.8	annual days of extreme heat
Extreme Precipitation	0.00	annual days with precipitation above 20 mm
Sea Level Rise	—	meters of inundation depth
Wildfire	0.19	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters
Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	N/A	N/A	N/A	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	N/A	N/A	N/A	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A

Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—
AQ-Ozone	11.6
AQ-PM	19.1
AQ-DPM	9.09
Drinking Water	30.6
Lead Risk Housing	50.8
Pesticides	90.5
Toxic Releases	7.58
Traffic	3.06
Effect Indicators	—
CleanUp Sites	74.2
Groundwater	77.9
Haz Waste Facilities/Generators	93.2
Impaired Water Bodies	100.0
Solid Waste	86.5

Sensitive Population	—
Asthma	87.6
Cardio-vascular	83.2
Low Birth Weights	26.9
Socioeconomic Factor Indicators	—
Education	82.7
Housing	51.4
Linguistic	88.8
Poverty	94.9
Unemployment	99.3

7.2. Healthy Places Index Scores

The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Economic	—
Above Poverty	16.66880534
Employed	7.173104068
Median HI	5.299627871
Education	—
Bachelor's or higher	5.017323239
High school enrollment	16.8741178

7.3. Overall Health & Equity Scores

Metric	Result for Project Census Tract
CalEnviroScreen 4.0 Score for Project Location (a)	82.0

Healthy Places Index Score for Project Location (b)	11.0
Project Located in a Designated Disadvantaged Community (Senate Bill 535)	Yes
Project Located in a Low-Income Community (Assembly Bill 1550)	Yes
Project Located in a Community Air Protection Program Community (Assembly Bill 617)	No

a: The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.
b: The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

7.4. Health & Equity Measures

No Health & Equity Measures selected.

7.5. Evaluation Scorecard

Health & Equity Evaluation Scorecard not completed.

7.6. Health & Equity Custom Measures

No Health & Equity Custom Measures created.

8. User Changes to Default Data

Screen	Justification
Construction: Construction Phases	Drilling phase represents the sum of drilling for 4 geothermal facilities, each requiring a 19-month drilling phase.
Construction: Off-Road Equipment	Equipment mix is based on example project for geothermal well drilling. Drilling operations would be conducted 24 hours/day. The Specific Plan has committed to Tier 4 Final engines for construction equipment.
Construction: Trips and VMT	Vendor trucks added based on geothermal project example.

5. Activity Data

5.1. Construction Schedule

Phase Name	Phase Type	Start Date	End Date	Days Per Week	Work Days per Phase	Phase Description
Drilling- All Facilities	Grading	1/1/2045	12/31/2047	5.00	782	—

5.2. Off-Road Equipment

5.2.1. Unmitigated

Phase Name	Equipment Type	Fuel Type	Engine Tier	Number per Day	Hours Per Day	Horsepower	Load Factor
Drilling- All Facilities	Generator Sets	Diesel	Tier 4 Final	4.00	24.0	25.0	0.74

Drilling- All Facilities	Pumps	Diesel	Tier 4 Final	1.00	24.0	25.0	0.74
Drilling- All Facilities	Bore/Drill Rigs	Diesel	Tier 4 Final	1.00	24.0	83.0	0.50
Drilling- All Facilities	Forklifts	Diesel	Tier 4 Final	5.00	24.0	82.0	0.20
Drilling- All Facilities	Aerial Lifts	Diesel	Tier 4 Final	1.00	24.0	46.0	0.31
Drilling- All Facilities	Tractors/Loaders/Backhoes	Diesel	Tier 4 Final	1.00	24.0	84.0	0.37

5.3. Construction Vehicles

5.3.1. Unmitigated

Phase Name	Trip Type	One-Way Trips per Day	Miles per Trip	Vehicle Mix
Drilling- All Facilities	—	—	—	—
Drilling- All Facilities	Worker	34.0	18.5	LDA,LDT1,LDT2
Drilling- All Facilities	Vendor	10.0	10.2	HHDT,MHDT
Drilling- All Facilities	Hauling	44.2	20.0	HHDT
Drilling- All Facilities	Onsite truck	—	—	HHDT

5.4. Vehicles

5.4.1. Construction Vehicle Control Strategies

Control Strategies Applied	PM10 Reduction	PM2.5 Reduction
Water unpaved roads twice daily	55%	55%
Limit vehicle speeds on unpaved roads to 25 mph	44%	44%
Sweep paved roads once per month	9%	9%

5.5. Architectural Coatings

Phase Name	Residential Interior Area Coated (sq ft)	Residential Exterior Area Coated (sq ft)	Non-Residential Interior Area Coated (sq ft)	Non-Residential Exterior Area Coated (sq ft)	Parking Area Coated (sq ft)

5.6. Dust Mitigation

5.6.1. Construction Earthmoving Activities

Phase Name	Material Imported (Cubic Yards)	Material Exported (Cubic Yards)	Acres Graded (acres)	Material Demolished (sq. ft.)	Acres Paved (acres)
Drilling- All Facilities	27,904	248,904	0.00	0.00	—

5.6.2. Construction Earthmoving Control Strategies

Control Strategies Applied	Frequency (per day)	PM10 Reduction	PM2.5 Reduction
Water Exposed Area	3	74%	74%

5.7. Construction Paving

Land Use	Area Paved (acres)	% Asphalt
General Heavy Industry	0.00	0%

5.8. Construction Electricity Consumption and Emissions Factors

kWh per Year and Emission Factor (lb/MWh)

Year	kWh per Year	CO2	CH4	N2O
2045	0.00	457	0.03	< 0.005
2046	0.00	457	0.03	< 0.005
2047	0.00	457	0.03	< 0.005

5.18. Vegetation

5.18.1. Land Use Change

5.18.1.1. Unmitigated

Vegetation Land Use Type	Vegetation Soil Type	Initial Acres	Final Acres

5.18.1. Biomass Cover Type

5.18.1.1. Unmitigated

Biomass Cover Type	Initial Acres	Final Acres

5.18.2. Sequestration

5.18.2.1. Unmitigated

Tree Type	Number	Electricity Saved (kWh/year)	Natural Gas Saved (btu/year)

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	32.8	annual days of extreme heat
Extreme Precipitation	0.00	annual days with precipitation above 20 mm
Sea Level Rise	—	meters of inundation depth
Wildfire	0.19	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters

Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	N/A	N/A	N/A	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	N/A	N/A	N/A	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—
AQ-Ozone	11.6
AQ-PM	19.1
AQ-DPM	9.09
Drinking Water	30.6
Lead Risk Housing	50.8
Pesticides	90.5
Toxic Releases	7.58
Traffic	3.06
Effect Indicators	—
CleanUp Sites	74.2
Groundwater	77.9
Haz Waste Facilities/Generators	93.2
Impaired Water Bodies	100.0
Solid Waste	86.5
Sensitive Population	—
Asthma	87.6

Cardio-vascular	83.2
Low Birth Weights	26.9
Socioeconomic Factor Indicators	—
Education	82.7
Housing	51.4
Linguistic	88.8
Poverty	94.9
Unemployment	99.3

7.2. Healthy Places Index Scores

The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Economic	—
Above Poverty	16.66880534
Employed	7.173104068
Median HI	5.299627871
Education	—
Bachelor's or higher	5.017323239
High school enrollment	16.8741178
Preschool enrollment	68.89516233

7.3. Overall Health & Equity Scores

Metric	Result for Project Census Tract
CalEnviroScreen 4.0 Score for Project Location (a)	82.0
Healthy Places Index Score for Project Location (b)	11.0
Project Located in a Designated Disadvantaged Community (Senate Bill 535)	Yes

Project Located in a Low-Income Community (Assembly Bill 1550)	Yes
Project Located in a Community Air Protection Program Community (Assembly Bill 617)	No

a: The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.
b: The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

7.4. Health & Equity Measures

No Health & Equity Measures selected.

7.5. Evaluation Scorecard

Health & Equity Evaluation Scorecard not completed.

7.6. Health & Equity Custom Measures

No Health & Equity Custom Measures created.

8. User Changes to Default Data

Screen	Justification
Construction: Construction Phases	Drilling phase represents period of construction for 2 geothermal facilities which would be constructed during Phase 3, each requiring a 19-month drilling phase.
Construction: Off-Road Equipment	Equipment mix is based on example project for geothermal well drilling. Drilling operations would be conducted 24 hours/day. The Specific Plan has committed to Tier 4 Final engines for construction equipment.
Construction: Trips and VMT	Vendor trucks added based on geothermal project example. An estimated 17 workers would be present on the project site at all times.

Linear, Drainage, Utilities, & Sub-Grade	—	50,000	381	0.00	—

5.6.2. Construction Earthmoving Control Strategies

Control Strategies Applied	Frequency (per day)	PM10 Reduction	PM2.5 Reduction
Water Exposed Area	3	74%	74%
Water Demolished Area	2	36%	36%

5.7. Construction Paving

Land Use	Area Paved (acres)	% Asphalt
Road Construction	174	100%
Road Widening	176	100%
Bridge/Overpass Construction	1.26	100%

5.8. Construction Electricity Consumption and Emissions Factors

kWh per Year and Emission Factor (lb/MWh)

Year	kWh per Year	CO2	CH4	N2O
2025	1,967	457	0.03	< 0.005
2026	3,933	457	0.03	< 0.005
2027	1,967	457	0.03	< 0.005
2028	1,967	457	0.03	< 0.005
2029	1,967	457	0.03	< 0.005
2030	3,933	457	0.03	< 0.005
2031	1,967	457	0.03	< 0.005
2032	1,967	457	0.03	< 0.005
2033	3,933	457	0.03	< 0.005
2034	1,967	457	0.03	< 0.005

5.18. Vegetation

5.18.1. Land Use Change

5.18.1.1. Unmitigated

Vegetation Land Use Type	Vegetation Soil Type	Initial Acres	Final Acres

5.18.1. Biomass Cover Type

5.18.1.1. Unmitigated

Biomass Cover Type	Initial Acres	Final Acres

5.18.2. Sequestration

5.18.2.1. Unmitigated

Tree Type	Number	Electricity Saved (kWh/year)	Natural Gas Saved (btu/year)

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	32.8	annual days of extreme heat
Extreme Precipitation	0.00	annual days with precipitation above 20 mm
Sea Level Rise	—	meters of inundation depth
Wildfire	0.19	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters
Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	N/A	N/A	N/A	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	N/A	N/A	N/A	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A

Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—
AQ-Ozone	11.6
AQ-PM	19.1
AQ-DPM	9.09
Drinking Water	30.6
Lead Risk Housing	50.8
Pesticides	90.5
Toxic Releases	7.58
Traffic	3.06
Effect Indicators	—
CleanUp Sites	74.2
Groundwater	77.9
Haz Waste Facilities/Generators	93.2
Impaired Water Bodies	100.0
Solid Waste	86.5

Sensitive Population	—
Asthma	87.6
Cardio-vascular	83.2
Low Birth Weights	26.9
Socioeconomic Factor Indicators	—
Education	82.7
Housing	51.4
Linguistic	88.8
Poverty	94.9
Unemployment	99.3

7.2. Healthy Places Index Scores

The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Economic	—
Above Poverty	16.66880534
Employed	7.173104068
Median HI	5.299627871
Education	—

7.3. Overall Health & Equity Scores

Metric	Result for Project Census Tract
CalEnviroScreen 4.0 Score for Project Location (a)	82.0

Healthy Places Index Score for Project Location (b)	11.0
Project Located in a Designated Disadvantaged Community (Senate Bill 535)	Yes
Project Located in a Low-Income Community (Assembly Bill 1550)	Yes
Project Located in a Community Air Protection Program Community (Assembly Bill 617)	No

a: The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.
b: The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

7.4. Health & Equity Measures

No Health & Equity Measures selected.

7.5. Evaluation Scorecard

Health & Equity Evaluation Scorecard not completed.

7.6. Health & Equity Custom Measures

No Health & Equity Custom Measures created.

8. User Changes to Default Data

Screen	Justification
Construction: Construction Phases	Land use data are based applicant-provided buildout assumptions. Phase 1 (2025-2029) represents 50% of 10-year buildout.
Construction: Off-Road Equipment	Tier 4 Final construction equipment assumed as part of the Lithium Valley Specific Plan.
Construction: Trips and VMT	Rounded up trips. Assumed haul trips based on paved area.
Construction: On-Road Fugitive Dust	85% paved roads assumed, according to ICAPCD guidance. PM reductions altered based on dust control plan implementation strategies (watering unpaved roads three times per day).
Construction: Paving	Paved area acreages calculated based on buildout estimates. Conservatively assumed 100% asphalt.
Construction: Architectural Coatings	6% of total area for striping.
Construction: Dust From Material Movement	Estimated material movement for roadways and infrastructure construction.

Tree Type	Number	Electricity Saved (kWh/year)	Natural Gas Saved (btu/year)

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	32.8	annual days of extreme heat
Extreme Precipitation	0.00	annual days with precipitation above 20 mm
Sea Level Rise	—	meters of inundation depth
Wildfire	0.19	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters
Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	N/A	N/A	N/A	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	N/A	N/A	N/A	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A

Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—
AQ-Ozone	11.6
AQ-PM	19.1
AQ-DPM	9.09
Drinking Water	30.6
Lead Risk Housing	50.8
Pesticides	90.5
Toxic Releases	7.58
Traffic	3.06
Effect Indicators	—
CleanUp Sites	74.2
Groundwater	77.9
Haz Waste Facilities/Generators	93.2
Impaired Water Bodies	100.0
Solid Waste	86.5

Sensitive Population	—
Asthma	87.6
Cardio-vascular	83.2
Low Birth Weights	26.9
Socioeconomic Factor Indicators	—
Education	82.7
Housing	51.4
Linguistic	88.8
Poverty	94.9
Unemployment	99.3

7.2. Healthy Places Index Scores

The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Economic	—
Above Poverty	16.66880534
Employed	7.173104068
Median HI	5.299627871
Education	—
Bachelor's or higher	5.017323239

7.3. Overall Health & Equity Scores

Metric	Result for Project Census Tract
CalEnviroScreen 4.0 Score for Project Location (a)	82.0

Healthy Places Index Score for Project Location (b)	11.0
Project Located in a Designated Disadvantaged Community (Senate Bill 535)	Yes
Project Located in a Low-Income Community (Assembly Bill 1550)	Yes
Project Located in a Community Air Protection Program Community (Assembly Bill 617)	No

a: The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.
b: The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

7.4. Health & Equity Measures

No Health & Equity Measures selected.

7.5. Evaluation Scorecard

Health & Equity Evaluation Scorecard not completed.

7.6. Health & Equity Custom Measures

No Health & Equity Custom Measures created.

8. User Changes to Default Data

Screen	Justification
Construction: Construction Phases	Land use data are based applicant-provided buildout assumptions. Phase 1 (2025-2029) represents 50% of 10-year buildout.
Construction: Off-Road Equipment	Tier 4 Final construction equipment assumed as part of the Lithium Valley Specific Plan.
Construction: Trips and VMT	Trips increased based on scaler per buildout methodology.
Construction: On-Road Fugitive Dust	All roads used by future developments projects within the Specific Plan Area would be required to be paved. Per ICAPCD guidance a value of 85% paved is assumed in the modeling to account for the high levels of entrained dust generated from vehicle travel on paved roadways in the region. PM reductions altered based on dust control plan implementation strategies (watering unpaved roads three times per day).
Construction: Paving	Paved area acreages calculated based on buildout estimates. Conservatively assumed 100% asphalt.
Construction: Architectural Coatings	Assumed 6% of total area for striping.
Construction: Dust From Material Movement	Estimated material movement for Phase 2 roadways and infrastructure construction.

2042	1,350	457	0.03	< 0.005
2043	675	457	0.03	< 0.005
2044	675	457	0.03	< 0.005
2050	675	457	0.03	< 0.005

5.18. Vegetation

5.18.1. Land Use Change

5.18.1.1. Unmitigated

Vegetation Land Use Type	Vegetation Soil Type	Initial Acres	Final Acres

5.18.1. Biomass Cover Type

5.18.1.1. Unmitigated

Biomass Cover Type	Initial Acres	Final Acres

5.18.2. Sequestration

5.18.2.1. Unmitigated

Tree Type	Number	Electricity Saved (kWh/year)	Natural Gas Saved (btu/year)

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	32.8	annual days of extreme heat
Extreme Precipitation	0.00	annual days with precipitation above 20 mm
Sea Level Rise	—	meters of inundation depth
Wildfire	0.19	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters
Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	N/A	N/A	N/A	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	N/A	N/A	N/A	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A

Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—
AQ-Ozone	11.6
AQ-PM	19.1
AQ-DPM	9.09
Drinking Water	30.6
Lead Risk Housing	50.8
Pesticides	90.5
Toxic Releases	7.58
Traffic	3.06
Effect Indicators	—
CleanUp Sites	74.2
Groundwater	77.9
Haz Waste Facilities/Generators	93.2
Impaired Water Bodies	100.0
Solid Waste	86.5

Sensitive Population	—
Asthma	87.6
Cardio-vascular	83.2
Low Birth Weights	26.9
Socioeconomic Factor Indicators	—
Education	82.7
Housing	51.4
Linguistic	88.8
Poverty	94.9
Unemployment	99.3

7.2. Healthy Places Index Scores

The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Economic	—
Above Poverty	16.66880534
Employed	7.173104068
Median HI	5.299627871
Education	—
Bachelor's or higher	5.017323239
High school enrollment	16.8741178
Preschool enrollment	68.89516233
Transportation	—
Auto Access	18.40112922
Active commuting	51.10997049
Social	—
2-parent households	13.28114975
Voting	16.79712563

Neighborhood	—
Alcohol availability	70.25535737
Park access	33.85089183
Retail density	4.311561658
Supermarket access	49.58295907
Tree canopy	0.782753753
Housing	—
Homeownership	38.3036058
Housing habitability	30.96368536
Low-inc homeowner severe housing cost burden	26.76761196
Low-inc renter severe housing cost burden	52.89362248
Uncrowded housing	38.58591043
Health Outcomes	—
Insured adults	21.00603105
Arthritis	0.0
Asthma ER Admissions	30.1
High Blood Pressure	0.0
Cancer (excluding skin)	0.0

7.3. Overall Health & Equity Scores

Metric	Result for Project Census Tract
CalEnviroScreen 4.0 Score for Project Location (a)	82.0

Healthy Places Index Score for Project Location (b)	11.0
Project Located in a Designated Disadvantaged Community (Senate Bill 535)	Yes
Project Located in a Low-Income Community (Assembly Bill 1550)	Yes
Project Located in a Community Air Protection Program Community (Assembly Bill 617)	No

a: The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.
b: The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

7.4. Health & Equity Measures

No Health & Equity Measures selected.

7.5. Evaluation Scorecard

Health & Equity Evaluation Scorecard not completed.

7.6. Health & Equity Custom Measures

No Health & Equity Custom Measures created.

8. User Changes to Default Data

Screen	Justification
Construction: Construction Phases	Land use data are based applicant-provided buildout assumptions. Phase 1 (2025-2029) represents 50% of 10-year buildout.
Construction: Off-Road Equipment	Tier 4 Final construction equipment assumed as part of the Lithium Valley Specific Plan.
Construction: Trips and VMT	Trips increased based on scaler per buildout methodology.
Construction: On-Road Fugitive Dust	All roads used by future developments projects within the Specific Plan Area would be required to be paved. Per ICAPCD guidance a value of 85% paved is assumed in the modeling to account for the high levels of entrained dust generated from vehicle travel on paved roadways in the region. PM reductions altered based on dust control plan implementation strategies (watering unpaved roads three times per day).
Construction: Paving	Paved area acreages calculated based on buildout estimates. Conservatively assumed 100% asphalt.
Construction: Off-Road Equipment EF	Assumed 2050 emission factors for years 2051-2054.
Construction: Architectural Coatings	Assumed 6% of total area for striping.
Construction: Dust From Material Movement	Export quantities for Phase 3 roadways and infrastructure construction.

5.18.1.1. Unmitigated

Biomass Cover Type	Initial Acres	Final Acres

5.18.2. Sequestration

5.18.2.1. Unmitigated

Tree Type	Number	Electricity Saved (kWh/year)	Natural Gas Saved (btu/year)

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	32.8	annual days of extreme heat
Extreme Precipitation	0.00	annual days with precipitation above 20 mm
Sea Level Rise	—	meters of inundation depth
Wildfire	0.19	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters
Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	N/A	N/A	N/A	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	N/A	N/A	N/A	N/A

Wildfire	N/A	N/A	N/A	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—
AQ-Ozone	11.6
AQ-PM	19.1
AQ-DPM	9.09
Drinking Water	30.6
Lead Risk Housing	50.8
Pesticides	90.5
Toxic Releases	7.58
Traffic	3.06
Effect Indicators	—
CleanUp Sites	74.2
Groundwater	77.9

Haz Waste Facilities/Generators	93.2
Impaired Water Bodies	100.0
Solid Waste	86.5
Sensitive Population	—
Asthma	87.6
Cardio-vascular	83.2
Low Birth Weights	26.9
Socioeconomic Factor Indicators	—
Education	82.7
Housing	51.4
Linguistic	88.8
Poverty	94.9
Unemployment	99.3

7.2. Healthy Places Index Scores

The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Economic	—
Above Poverty	16.66880534
Employed	7.173104068
Median HI	5.299627871
Education	—
Bachelor's or higher	5.017323239

7.3. Overall Health & Equity Scores

Metric	Result for Project Census Tract
CalEnviroScreen 4.0 Score for Project Location (a)	82.0
Healthy Places Index Score for Project Location (b)	11.0
Project Located in a Designated Disadvantaged Community (Senate Bill 535)	Yes
Project Located in a Low-Income Community (Assembly Bill 1550)	Yes
Project Located in a Community Air Protection Program Community (Assembly Bill 617)	No

a: The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.
b: The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

7.4. Health & Equity Measures

No Health & Equity Measures selected.

7.5. Evaluation Scorecard

Health & Equity Evaluation Scorecard not completed.

7.6. Health & Equity Custom Measures

No Health & Equity Custom Measures created.

8. User Changes to Default Data

Screen	Justification
Land Use	Land use data are based on applicant-provided buildout assumptions.
Operations: Vehicle Data	Based on SANDAG trip rate for regional, developed park. Defaults for trip length were not changed.
Operations: Road Dust	85% of roads assumed to be paved based on ICAPCD guidance and project narrative.
Operations: Landscape Equipment	Assumed 270 summer days for desert region.
Operations: Water and Waste Water	Water data are based on applicant-provided calculations for the land use.

4. Operations Emissions Details

4.1. Mobile Emissions by Land Use

4.1.1. Unmitigated

Mobile source emissions results are presented in Sections 2.6. No further detailed breakdown of emissions is available.

4.2. Energy

4.2.1. Electricity Emissions By Land Use - Unmitigated

Criteria Pollutants (lb/day for daily, ton/yr for annual) and GHGs (lb/day for daily, MT/yr for annual)

Land Use	TOG	ROG	NOx	CO	SO2	PM10E	PM10D	PM10T	PM2.5E	PM2.5D	PM2.5T	BCO2	NBCO2	CO2T	CH4	N2O	R	CO2e

General Heavy Industry	User Defined	User Defined	23,900	0.01	0.50	0.50	30.0

5.15. Operational Off-Road Equipment

5.15.1. Unmitigated

Equipment Type	Fuel Type	Engine Tier	Number per Day	Hours Per Day	Horsepower	Load Factor

5.16. Stationary Sources

5.16.1. Emergency Generators and Fire Pumps

Equipment Type	Fuel Type	Number per Day	Hours per Day	Hours per Year	Horsepower	Load Factor
Emergency Generator	Diesel	1.00	1.00	50.0	500	0.73

5.16.2. Process Boilers

Equipment Type	Fuel Type	Number	Boiler Rating (MMBtu/hr)	Daily Heat Input (MMBtu/day)	Annual Heat Input (MMBtu/yr)

5.17. User Defined

Equipment Type	Fuel Type

5.18. Vegetation

5.18.1. Land Use Change

5.18.1.1. Unmitigated

Vegetation Land Use Type	Vegetation Soil Type	Initial Acres	Final Acres

5.18.1. Biomass Cover Type

5.18.1.1. Unmitigated

Biomass Cover Type	Initial Acres	Final Acres

5.18.2. Sequestration

5.18.2.1. Unmitigated

Tree Type	Number	Electricity Saved (kWh/year)	Natural Gas Saved (btu/year)

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	32.8	annual days of extreme heat
Extreme Precipitation	0.00	annual days with precipitation above 20 mm
Sea Level Rise	—	meters of inundation depth
Wildfire	0.19	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters
Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A

Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	N/A	N/A	N/A	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	N/A	N/A	N/A	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—
AQ-Ozone	11.6
AQ-PM	19.1
AQ-DPM	9.09
Drinking Water	30.6
Lead Risk Housing	50.8
Pesticides	90.5
Toxic Releases	7.58
Traffic	3.06
Effect Indicators	—
CleanUp Sites	74.2
Groundwater	77.9
Haz Waste Facilities/Generators	93.2
Impaired Water Bodies	100.0
Solid Waste	86.5
Sensitive Population	—
Asthma	87.6
Cardio-vascular	83.2
Low Birth Weights	26.9
Socioeconomic Factor Indicators	—
Education	82.7
Housing	51.4
Linguistic	88.8

Poverty	94.9
Unemployment	99.3

7.2. Healthy Places Index Scores

The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Economic	—
Above Poverty	16.66880534
Employed	7.173104068
Median HI	5.299627871
Education	—
Bachelor's or higher	5.017323239

7.3. Overall Health & Equity Scores

Metric	Result for Project Census Tract
CalEnviroScreen 4.0 Score for Project Location (a)	82.0
Healthy Places Index Score for Project Location (b)	11.0
Project Located in a Designated Disadvantaged Community (Senate Bill 535)	Yes
Project Located in a Low-Income Community (Assembly Bill 1550)	Yes
Project Located in a Community Air Protection Program Community (Assembly Bill 617)	No

a: The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.
b: The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

7.4. Health & Equity Measures

No Health & Equity Measures selected.

7.5. Evaluation Scorecard

Health & Equity Evaluation Scorecard not completed.

7.6. Health & Equity Custom Measures

No Health & Equity Custom Measures created.

8. User Changes to Default Data

Screen	Justification
Land Use	Land use data are based on applicant-provided buildout assumptions. 10,000 square feet of building anticipated for operation. No landscaping anticipated for agrivoltaics
Operations: Water and Waste Water	Water consumption calculated by applicant. No indoor water usage anticipated.
Operations: Refrigerants	Assumed 500lbs. of SF6 for project operations.
Operations: Landscape Equipment	Assumed 270 summer days for desert region.
Operations: Emergency Generators and Fire Pumps	Assumed 1 back-up generator operating 1 hour/day and 50 hours/year for maintne
Operations: Energy Use	Natural gas not anticipated as part of project operations. Natural gas consumption converted to electricity.
Operations: Road Dust	All roads used by future developments projects within the Specific Plan Area would be required to be paved. Per ICAPCD guidance a value of 85% paved is assumed in the modeling to account for the high levels of entrained dust generated from vehicle travel on paved roadways in the region

5.18.2. Sequestration

5.18.2.1. Unmitigated

Tree Type	Number	Electricity Saved (kWh/year)	Natural Gas Saved (btu/year)

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	32.8	annual days of extreme heat
Extreme Precipitation	0.00	annual days with precipitation above 20 mm
Sea Level Rise	—	meters of inundation depth
Wildfire	0.19	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters
Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	N/A	N/A	N/A	N/A

Wildfire	N/A	N/A	N/A	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	N/A	N/A	N/A	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—
AQ-Ozone	11.6
AQ-PM	19.1
AQ-DPM	9.09
Drinking Water	30.6
Lead Risk Housing	50.8
Pesticides	90.5
Toxic Releases	7.58
Traffic	3.06
Effect Indicators	—
CleanUp Sites	74.2
Groundwater	77.9
Haz Waste Facilities/Generators	93.2
Impaired Water Bodies	100.0
Solid Waste	86.5

7.3. Overall Health & Equity Scores

Metric	Result for Project Census Tract
CalEnviroScreen 4.0 Score for Project Location (a)	82.0
Healthy Places Index Score for Project Location (b)	11.0
Project Located in a Designated Disadvantaged Community (Senate Bill 535)	Yes
Project Located in a Low-Income Community (Assembly Bill 1550)	Yes
Project Located in a Community Air Protection Program Community (Assembly Bill 617)	No

a: The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.
b: The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

7.4. Health & Equity Measures

No Health & Equity Measures selected.

7.5. Evaluation Scorecard

Health & Equity Evaluation Scorecard not completed.

7.6. Health & Equity Custom Measures

No Health & Equity Custom Measures created.

8. User Changes to Default Data

Screen	Justification
Land Use	Land use data are based on applicant-provided buildout assumptions.
Operations: Vehicle Data	Trip rates are based on ITE Land Use Code 170.
Operations: Landscape Equipment	Assumed 270 summer days for desert region.
Operations: Road Dust	All roads used by future developments projects within the Specific Plan Area would be required to be paved. Per ICAPCD guidance a value of 85% paved is assumed in the modeling to account for the high levels of entrained dust generated from vehicle travel on paved roadways in the region
Operations: Water and Waste Water	Water data are based on applicant-provided calculations for the land use.
Operations: Off-Road Equipment	Assumed a tractor/loader/backhoe as part of project operations.

1. Basic Project Information

1.1. Basic Project Information

Data Field	Value
Project Name	Lithium Valley Operation - Phase 1 - Automobile Manufacturing
Operational Year	2035
Lead Agency	—
Land Use Scale	Project/site
Analysis Level for Defaults	County
Windspeed (m/s)	3.40
Precipitation (days)	4.80
Location	33.18829759139308, -115.6026869228474
County	Imperial
City	Unincorporated
Air District	Imperial County APCD
Air Basin	Salton Sea
TAZ	5600
EDFZ	19
Electric Utility	Imperial Irrigation District
Gas Utility	Southern California Gas
App Version	2022.1.1.29

1.2. Land Use Types

Land Use Subtype	Size	Unit	Lot Acreage	Building Area (sq ft)	Landscape Area (sq ft)	Special Landscape Area (sq ft)	Population	Description
Manufacturing	240	1000sqft	147	239,691	119,846	—	—	—
Parking Lot	1,198	1000sqft	27.5	0.00	0.00	—	—	—

1.3. User-Selected Emission Reduction Measures by Emissions Sector

No measures selected

2. Emissions Summary

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	32.8	annual days of extreme heat
Extreme Precipitation	0.00	annual days with precipitation above 20 mm

Sea Level Rise	—	meters of inundation depth
Wildfire	0.19	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters
Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	N/A	N/A	N/A	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A

Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	N/A	N/A	N/A	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—
AQ-Ozone	11.6
AQ-PM	19.1
AQ-DPM	9.09
Drinking Water	30.6
Lead Risk Housing	50.8
Pesticides	90.5
Toxic Releases	7.58
Traffic	3.06
Effect Indicators	—

CleanUp Sites	74.2
Groundwater	77.9
Haz Waste Facilities/Generators	93.2
Impaired Water Bodies	100.0
Solid Waste	86.5
Sensitive Population	—
Asthma	87.6
Cardio-vascular	83.2
Low Birth Weights	26.9
Socioeconomic Factor Indicators	—
Education	82.7
Housing	51.4
Linguistic	88.8
Poverty	94.9
Unemployment	99.3

7.2. Healthy Places Index Scores

The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Economic	—
Above Poverty	16.66880534
Employed	7.173104068
Median HI	5.299627871
Education	—
Bachelor's or higher	5.017323239

7.3. Overall Health & Equity Scores

Metric	Result for Project Census Tract
CalEnviroScreen 4.0 Score for Project Location (a)	82.0
Healthy Places Index Score for Project Location (b)	11.0
Project Located in a Designated Disadvantaged Community (Senate Bill 535)	Yes
Project Located in a Low-Income Community (Assembly Bill 1550)	Yes
Project Located in a Community Air Protection Program Community (Assembly Bill 617)	No

a: The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.
b: The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

7.4. Health & Equity Measures

No Health & Equity Measures selected.

7.5. Evaluation Scorecard

Health & Equity Evaluation Scorecard not completed.

7.6. Health & Equity Custom Measures

No Health & Equity Custom Measures created.

8. User Changes to Default Data

Screen	Justification
Land Use	Land use data are based on applicant-provided buildout assumptions.
Operations: Landscape Equipment	Assumed 270 summer days for desert region.
Operations: Vehicle Data	Trip rates are based on ITE Land Use Code 140.
Operations: Road Dust	85% of roads assumed to be paved based on ICAPCD guidance and project narrative.
Operations: Off-Road Equipment	Assumed offroad equipment as part of project operations. Number of equipment based on SCAQMD Study (0.12 per KSF).
Operations: Water and Waste Water	Water data are based on applicant-provided calculations for the land use.

5.18.1. Biomass Cover Type

5.18.1.1. Unmitigated

Biomass Cover Type	Initial Acres	Final Acres

5.18.2. Sequestration

5.18.2.1. Unmitigated

Tree Type	Number	Electricity Saved (kWh/year)	Natural Gas Saved (btu/year)

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	32.8	annual days of extreme heat
Extreme Precipitation	0.00	annual days with precipitation above 20 mm

Sea Level Rise	—	meters of inundation depth
Wildfire	0.19	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters
Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	N/A	N/A	N/A	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A

Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	N/A	N/A	N/A	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—
AQ-Ozone	11.6
AQ-PM	19.1
AQ-DPM	9.09
Drinking Water	30.6
Lead Risk Housing	50.8
Pesticides	90.5
Toxic Releases	7.58
Traffic	3.06
Effect Indicators	—

CleanUp Sites	74.2
Groundwater	77.9
Haz Waste Facilities/Generators	93.2
Impaired Water Bodies	100.0
Solid Waste	86.5
Sensitive Population	—
Asthma	87.6
Cardio-vascular	83.2
Low Birth Weights	26.9
Socioeconomic Factor Indicators	—
Education	82.7
Housing	51.4
Linguistic	88.8
Poverty	94.9
Unemployment	99.3

7.2. Healthy Places Index Scores

The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Economic	—
Above Poverty	16.66880534
Employed	7.173104068
Median HI	5.299627871

7.3. Overall Health & Equity Scores

Metric	Result for Project Census Tract
CalEnviroScreen 4.0 Score for Project Location (a)	82.0
Healthy Places Index Score for Project Location (b)	11.0
Project Located in a Designated Disadvantaged Community (Senate Bill 535)	Yes
Project Located in a Low-Income Community (Assembly Bill 1550)	Yes
Project Located in a Community Air Protection Program Community (Assembly Bill 617)	No

a: The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.
b: The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

7.4. Health & Equity Measures

No Health & Equity Measures selected.

7.5. Evaluation Scorecard

Health & Equity Evaluation Scorecard not completed.

7.6. Health & Equity Custom Measures

No Health & Equity Custom Measures created.

8. User Changes to Default Data

Screen	Justification
Land Use	Land use data are based on applicant-provided buildout assumptions.
Operations: Vehicle Data	Trip rates are based on ITE Land Use Code 140.
Operations: Landscape Equipment	Assumed 270 summer days for desert region.
Operations: Emergency Generators and Fire Pumps	Assumed 3 back-up generators each operating 1 hour/day and 50 hours/year for maintenance and testing.

Operations: Road Dust	All roads used by future developments projects within the Specific Plan Area would be required to be paved. Per ICAPCD guidance a value of 85% paved is assumed in the modeling to account for the high levels of entrained dust generated from vehicle travel on paved roadways in the region
Operations: Water and Waste Water	Water data are based on applicant-provided calculations for the land use.
Operations: Off-Road Equipment	Electric forklifts assumed as part of project operations.

4. Operations Emissions Details

4.1. Mobile Emissions by Land Use

4.1.1. Unmitigated

Mobile source emissions results are presented in Sections 2.6. No further detailed breakdown of emissions is available.

4.2. Energy

4.2.1. Electricity Emissions By Land Use - Unmitigated

Criteria Pollutants (lb/day for daily, ton/yr for annual) and GHGs (lb/day for daily, MT/yr for annual)

Land Use	TOG	ROG	NOx	CO	SO2	PM10E	PM10D	PM10T	PM2.5E	PM2.5D	PM2.5T	BCO2	NBCO2	CO2T	CH4	N2O	R	CO2e

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	32.8	annual days of extreme heat
Extreme Precipitation	0.00	annual days with precipitation above 20 mm
Sea Level Rise	—	meters of inundation depth
Wildfire	0.19	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters
Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	N/A	N/A	N/A	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	N/A	N/A	N/A	N/A

Wildfire	N/A	N/A	N/A	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—
AQ-Ozone	11.6
AQ-PM	19.1
AQ-DPM	9.09
Drinking Water	30.6
Lead Risk Housing	50.8
Pesticides	90.5
Toxic Releases	7.58
Traffic	3.06
Effect Indicators	—
CleanUp Sites	74.2
Groundwater	77.9

Haz Waste Facilities/Generators	93.2

7.3. Overall Health & Equity Scores

Metric	Result for Project Census Tract
CalEnviroScreen 4.0 Score for Project Location (a)	82.0
Healthy Places Index Score for Project Location (b)	11.0
Project Located in a Designated Disadvantaged Community (Senate Bill 535)	Yes
Project Located in a Low-Income Community (Assembly Bill 1550)	Yes
Project Located in a Community Air Protection Program Community (Assembly Bill 617)	No

a: The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.
b: The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

7.4. Health & Equity Measures

No Health & Equity Measures selected.

7.5. Evaluation Scorecard

Health & Equity Evaluation Scorecard not completed.

7.6. Health & Equity Custom Measures

No Health & Equity Custom Measures created.

8. User Changes to Default Data

Screen	Justification
Land Use	Land use data are based on applicant-provided buildout assumptions.
Operations: Energy Use	No natural gas. 11,680,000 kWh/year based on auxiliary energy consumption (2%) calculated based on an assumed 400 MW capacity, operating 4 hours/day and 365 days/year.
Operations: Water and Waste Water	Water data are based on applicant-provided calculations for the land use. No indoor water required for operations.
Operations: Off-Road Equipment	Project operations anticipated to require periodic maintenance that requires cranes to move battery units around every 3 years.
Operations: Refrigerants	Assumed 1,000 pounds of SF6 as part of project operations for breakers/inverters.
Operations: Landscape Equipment	Assumed 270 summer days for desert region.

Operations: Emergency Generators and Fire Pumps	Assumed 1 back-up generator operating 1 hour/day and 50 hours/year as part of project operations.
Operations: Road Dust	85% of roads assumed to be paved based on ICAPCD guidance and project narrative.

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	32.8	annual days of extreme heat
Extreme Precipitation	0.00	annual days with precipitation above 20 mm
Sea Level Rise	—	meters of inundation depth
Wildfire	0.19	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters
Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	N/A	N/A	N/A	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A

Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	N/A	N/A	N/A	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—
AQ-Ozone	11.6
AQ-PM	19.1
AQ-DPM	9.09
Drinking Water	30.6
Lead Risk Housing	50.8
Pesticides	90.5
Toxic Releases	7.58
Traffic	3.06
Effect Indicators	—
CleanUp Sites	74.2
Groundwater	77.9
Haz Waste Facilities/Generators	93.2
Impaired Water Bodies	100.0
Solid Waste	86.5
Sensitive Population	—
Asthma	87.6
Cardio-vascular	83.2
Low Birth Weights	26.9
Socioeconomic Factor Indicators	—
Education	82.7
Housing	51.4
Linguistic	88.8
Poverty	94.9
Unemployment	99.3

7.2. Healthy Places Index Scores

The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Economic	—
Above Poverty	16.66880534
Employed	7.173104068
Median HI	5.299627871

7.3. Overall Health & Equity Scores

Metric	Result for Project Census Tract
CalEnviroScreen 4.0 Score for Project Location (a)	82.0
Healthy Places Index Score for Project Location (b)	11.0
Project Located in a Designated Disadvantaged Community (Senate Bill 535)	Yes
Project Located in a Low-Income Community (Assembly Bill 1550)	Yes
Project Located in a Community Air Protection Program Community (Assembly Bill 617)	No

a: The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.
b: The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

7.4. Health & Equity Measures

No Health & Equity Measures selected.

7.5. Evaluation Scorecard

Health & Equity Evaluation Scorecard not completed.

7.6. Health & Equity Custom Measures

No Health & Equity Custom Measures created.

8. User Changes to Default Data

Screen	Justification
Land Use	Land use data are based on applicant-provided buildout assumptions.
Operations: Vehicle Data	Trip rates are based on ITE Land Use Code 130.
Operations: Landscape Equipment	Assumed 270 summer days for desert region.
Operations: Off-Road Equipment	Assumed offroad equipment as part of project operations.
Operations: Road Dust	All roads used by future developments projects within the Specific Plan Area would be required to be paved. Per ICAPCD guidance a value of 85% paved is assumed in the modeling to account for the high levels of entrained dust generated from vehicle travel on paved roadways in the region
Operations: Water and Waste Water	Water data are based on applicant-provided calculations for the land use.

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	32.8	annual days of extreme heat
Extreme Precipitation	0.00	annual days with precipitation above 20 mm
Sea Level Rise	—	meters of inundation depth
Wildfire	0.19	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters
Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	N/A	N/A	N/A	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	N/A	N/A	N/A	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—
AQ-Ozone	11.6

AQ-PM	19.1
AQ-DPM	9.09
Drinking Water	30.6
Lead Risk Housing	50.8
Pesticides	90.5
Toxic Releases	7.58
Traffic	3.06
Effect Indicators	—
CleanUp Sites	74.2
Groundwater	77.9
Haz Waste Facilities/Generators	93.2
Impaired Water Bodies	100.0
Solid Waste	86.5
Sensitive Population	—
Asthma	87.6
Cardio-vascular	83.2
Low Birth Weights	26.9
Socioeconomic Factor Indicators	—
Education	82.7
Housing	51.4
Linguistic	88.8
Poverty	94.9
Unemployment	99.3

7.2. Healthy Places Index Scores

The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Economic	—

Above Poverty	16.66880534
Employed	7.173104068
Median HI	5.299627871
Education	—
Bachelor's or higher	5.017323239
High school enrollment	16.8741178
Preschool enrollment	68.89516233

7.3. Overall Health & Equity Scores

Metric	Result for Project Census Tract
CalEnviroScreen 4.0 Score for Project Location (a)	82.0
Healthy Places Index Score for Project Location (b)	11.0
Project Located in a Designated Disadvantaged Community (Senate Bill 535)	Yes
Project Located in a Low-Income Community (Assembly Bill 1550)	Yes
Project Located in a Community Air Protection Program Community (Assembly Bill 617)	No

a: The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.
b: The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

7.4. Health & Equity Measures

No Health & Equity Measures selected.

7.5. Evaluation Scorecard

Health & Equity Evaluation Scorecard not completed.

7.6. Health & Equity Custom Measures

No Health & Equity Custom Measures created.

8. User Changes to Default Data

Screen	Justification
Land Use	Land use data are based on applicant-provided buildout assumptions.
Operations: Landscape Equipment	Assumed 270 summer days for desert region.
Operations: Water and Waste Water	Water calculation based on applicant-provided figures.
Operations: Vehicle Data	Trip rates changed based on suggested ITE trip rates.
Operations: Road Dust	85% of roads assumed to be paved based on ICAPCD guidance and project narrative.

Tree Type	Number	Electricity Saved (kWh/year)	Natural Gas Saved (btu/year)

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	32.8	annual days of extreme heat
Extreme Precipitation	0.00	annual days with precipitation above 20 mm
Sea Level Rise	—	meters of inundation depth
Wildfire	0.19	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters
Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	N/A	N/A	N/A	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	N/A	N/A	N/A	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—
AQ-Ozone	11.6

AQ-PM	19.1
AQ-DPM	9.09
Drinking Water	30.6
Lead Risk Housing	50.8
Pesticides	90.5
Toxic Releases	7.58
Traffic	3.06
Effect Indicators	—
CleanUp Sites	74.2
Groundwater	77.9
Haz Waste Facilities/Generators	93.2
Impaired Water Bodies	100.0
Solid Waste	86.5
Sensitive Population	—
Asthma	87.6
Cardio-vascular	83.2
Low Birth Weights	26.9
Socioeconomic Factor Indicators	—
Education	82.7
Housing	51.4
Linguistic	88.8
Poverty	94.9
Unemployment	99.3

7.2. Healthy Places Index Scores

The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Economic	—

Above Poverty	16.66880534
Employed	7.173104068
Median HI	5.299627871
Education	—
Bachelor's or higher	5.017323239

7.3. Overall Health & Equity Scores

Metric	Result for Project Census Tract
CalEnviroScreen 4.0 Score for Project Location (a)	82.0
Healthy Places Index Score for Project Location (b)	11.0
Project Located in a Designated Disadvantaged Community (Senate Bill 535)	Yes
Project Located in a Low-Income Community (Assembly Bill 1550)	Yes
Project Located in a Community Air Protection Program Community (Assembly Bill 617)	No

a: The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.
b: The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

7.4. Health & Equity Measures

No Health & Equity Measures selected.

7.5. Evaluation Scorecard

Health & Equity Evaluation Scorecard not completed.

7.6. Health & Equity Custom Measures

No Health & Equity Custom Measures created.

8. User Changes to Default Data

Screen	Justification
Land Use	Land use data are based on applicant-provided buildout assumptions.
Operations: Vehicle Data	Trip rates based on ITE Land Use Code 160.
Operations: Landscape Equipment	Assumed 270 summer days for desert region.
Operations: Emergency Generators and Fire Pumps	Assumed 127 back-up generators each operating 1 hour/day and 50 hours/year for maintenance and testing.
Operations: Road Dust	All roads used by future developments projects within the Specific Plan Area would be required to be paved. Per ICAPCD guidance a value of 85% paved is assumed in the modeling to account for the high levels of entrained dust generated from vehicle travel on paved roadways in the region
Operations: Water and Waste Water	Water data are based on applicant-provided calculations for the land use.
Operations: Energy Use	Electricity data are based on anticipated electricity demand of data center.
Operations: Generators + Pumps EF	—

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	32.8	annual days of extreme heat
Extreme Precipitation	0.00	annual days with precipitation above 20 mm
Sea Level Rise	—	meters of inundation depth
Wildfire	0.19	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters
Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	N/A	N/A	N/A	N/A
Wildfire	N/A	N/A	N/A	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	N/A	N/A	N/A	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	N/A	N/A	N/A	N/A

Wildfire	N/A	N/A	N/A	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	N/A	N/A	N/A	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—
AQ-Ozone	11.6
AQ-PM	19.1
AQ-DPM	9.09
Drinking Water	30.6
Lead Risk Housing	50.8
Pesticides	90.5
Toxic Releases	7.58
Traffic	3.06
Effect Indicators	—
CleanUp Sites	74.2
Groundwater	77.9

Haz Waste Facilities/Generators	93.2
Impaired Water Bodies	100.0

7.3. Overall Health & Equity Scores

Metric	Result for Project Census Tract
CalEnviroScreen 4.0 Score for Project Location (a)	82.0
Healthy Places Index Score for Project Location (b)	11.0
Project Located in a Designated Disadvantaged Community (Senate Bill 535)	Yes
Project Located in a Low-Income Community (Assembly Bill 1550)	Yes
Project Located in a Community Air Protection Program Community (Assembly Bill 617)	No

a: The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.
b: The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

7.4. Health & Equity Measures

No Health & Equity Measures selected.

7.5. Evaluation Scorecard

Health & Equity Evaluation Scorecard not completed.

7.6. Health & Equity Custom Measures

No Health & Equity Custom Measures created.

8. User Changes to Default Data

Screen	Justification
Land Use	Land use data are based on applicant-provided buildout assumptions.
Operations: Vehicle Data	Trip rates are based on ITE Land Use Code 575 PM rate.
Operations: Landscape Equipment	Assumed 270 summer days for desert region.
Operations: Road Dust	All roads used by future developments projects within the Specific Plan Area would be required to be paved. Per ICAPCD guidance a value of 85% paved is assumed in the modeling to account for the high levels of entrained dust generated from vehicle travel on paved roadways in the region
Operations: Water and Waste Water	Water data are based on applicant-provided calculations for the land use.
Operations: Emergency Generators and Fire Pumps	Assumed 4 back-up generators each operating 1 hour/day and 50 hours/year for maintenance and testing.
